

Introduction

This Book is different from most CGI Programming Books. It's different in the way it teaches in that it starts positively at the beginning of the programming experience.

Most CGI training books claim they are for the beginner but they automatically assume that you know or have at least some amount of experience with HTML or C or some other language.

This book doesn't do that. This book does just the opposite. This book will teach you how to start programming from the beginning in that it thinks this is the first time you have ever sat down at a computer and are not computer literate at all.

In fact it thinks that you are scared and don't have any idea of what to do. That's ok. I now where you are coming from and I am here to help you and not Lord over you.

This Book is also different that it takes in fact that you will be sitting at your computer and holding this book open with one hand and pressing keys on the key board with the other while you are trying to read the fine print with your eyes so the print is larger and bolder than most books. If you don't know what I am talking about you will soon.

All the programs is this book have been tested and re-tested.
