Using LuaFTeX to typeset RTL text with reledpar

Abstract

This file provides an example of how to use reledpar and LuaETeX to typeset a right to left text with its translation on the facing page¹.

As you can see, the switch to RTL convention is made *before* the pstart. It must be also called inside *\eledsection*.

For an example with XHTEX, look at parallel-column-two-languages.tex file.
