602 <*2ekernel>

```

`\@setupverbvisiblespace` In pdfTeX a catcode 12 space will produce the character in slot 32 which is assumed to be a visible space character (in a typewriter font in OT1 or T1 encoding). In XeTeX or LuaTeX a font in TU encoding is normally used and that has a real space in this slot. So what we do in this case is this: we check the definition of `\verbvisiblespace` and if it is `\asciispace` we assume that the char32 can be used (e.g., in pdfTeX). We then redefine `\@xobeysp` so that after running `\@xobeyspaces` we get characters from slot 32 for each active space.

```

603 </2ekernel>
604 <*2ekernel | latexrelease>

608   \ifx\verbvisiblespace\asciispace
609     \let\@xobeysp\asciispace
610   \else

```

Otherwise we measure the width of a character in the mono-spaced current font and place a `\verbvisiblespace` into a box of the right width which we are then using as the character for a space. By default this will be the space character from OT1 cmtt but by changing `\verbvisiblespace` one could use, for example, the `\textvisiblespace` of the current typewriter font.

## File 38

# ltmath.dtx

## 1 Math setup

This file contains a lot of the original plain T<sub>E</sub>X code, as well as the L<sup>A</sup>T<sub>E</sub>X environments for math. It still needs sorting out.

```
1 <*2kernel>
2 \message{math definitions,}
```

### 1.1 Math commands based on plain T<sub>E</sub>X

#### 1.1.1 The log-like functions

\log The standard operators:

```
3 \DeclareRobustCommand\log{\mathop{\operator@font log}\nolimits}
4 \DeclareRobustCommand\lg{\mathop{\operator@font lg}\nolimits}
5 \DeclareRobustCommand\ln{\mathop{\operator@font ln}\nolimits}
6 \DeclareRobustCommand\lim{\mathop{\operator@font lim}}
7 \DeclareRobustCommand\limsup{\mathop{\operator@font lim}\,sup}}
8 \DeclareRobustCommand\liminf{\mathop{\operator@font lim}\,inf}}
9 \DeclareRobustCommand\sin{\mathop{\operator@font sin}\nolimits}
10 \DeclareRobustCommand\arcsin{\mathop{\operator@font arcsin}\nolimits}
11 \DeclareRobustCommand\sinh{\mathop{\operator@font sinh}\nolimits}
12 \DeclareRobustCommand\cos{\mathop{\operator@font cos}\nolimits}
13 \DeclareRobustCommand\arccos{\mathop{\operator@font arccos}\nolimits}
14 \DeclareRobustCommand\cosh{\mathop{\operator@font cosh}\nolimits}
15 \DeclareRobustCommand\tan{\mathop{\operator@font tan}\nolimits}
16 \DeclareRobustCommand\arctan{\mathop{\operator@font arctan}\nolimits}
17 \DeclareRobustCommand\tanh{\mathop{\operator@font tanh}\nolimits}
18 \DeclareRobustCommand\cot{\mathop{\operator@font cot}\nolimits}
19 \DeclareRobustCommand\coth{\mathop{\operator@font coth}\nolimits}
20 \DeclareRobustCommand\sec{\mathop{\operator@font sec}\nolimits}
21 \DeclareRobustCommand\csc{\mathop{\operator@font csc}\nolimits}
22 \DeclareRobustCommand\max{\mathop{\operator@font max}}
23 \DeclareRobustCommand\min{\mathop{\operator@font min}}
24 \DeclareRobustCommand\sup{\mathop{\operator@font sup}}
25 \DeclareRobustCommand\inf{\mathop{\operator@font inf}}
26 \DeclareRobustCommand\arg{\mathop{\operator@font arg}\nolimits}
27 \DeclareRobustCommand\ker{\mathop{\operator@font ker}\nolimits}
28 \DeclareRobustCommand\dim{\mathop{\operator@font dim}\nolimits}
29 \DeclareRobustCommand\hom{\mathop{\operator@font hom}\nolimits}
30 \DeclareRobustCommand\det{\mathop{\operator@font det}}
31 \DeclareRobustCommand\exp{\mathop{\operator@font exp}\nolimits}
32 \DeclareRobustCommand\Pr{\mathop{\operator@font Pr}}
33 \DeclareRobustCommand\gcd{\mathop{\operator@font gcd}}
34 \DeclareRobustCommand\deg{\mathop{\operator@font deg}\nolimits}
```

*(End of definition for \log.)*

\bmod And some operators have to be done by hand:

```

35 \DeclareRobustCommand\bmod{%
36   \nonscript\mskip-\medmuskip\mkern5mu%
37   \mathbin{\operator@font mod}\penalty900\mkern5mu%
38   \nonscript\mskip-\medmuskip}

```

*(End of definition for \bmod.)*

**\pmod**

```

39 \DeclareRobustCommand\pmod[1]{%
40   \allowbreak\mkern18mu({\operator@font mod}\,\,\,#1)}

```

*(End of definition for \pmod.)*

### 1.1.2 Biggggg

**\big** Variants on **\big** and friends for use with delimiters:

```

41 \DeclareRobustCommand\bigl{\mathopen\big}
42 \DeclareRobustCommand\bigm{\mathrel\big}
43 \DeclareRobustCommand\bigl{\mathclose\big}
44 \DeclareRobustCommand\Bigl{\mathopen\Big}
45 \DeclareRobustCommand\Bigm{\mathrel\Big}
46 \DeclareRobustCommand\Bigl{\mathclose\Big}
47 \DeclareRobustCommand\biggl{\mathopen\bigg}
48 \DeclareRobustCommand\biggm{\mathrel\bigg}
49 \DeclareRobustCommand\biggr{\mathclose\bigg}
50 \DeclareRobustCommand\Biggl{\mathopen\Bigg}
51 \DeclareRobustCommand\Biggm{\mathrel\Bigg}
52 \DeclareRobustCommand\Biggr{\mathclose\Bigg}

```

*(End of definition for \big.)*

### 1.1.3 The UNSORTED Rest

The other math commands are lifted from plain T<sub>E</sub>X.

**\jot**

```

53 \newdimen\jot
54 \jot=3pt

```

*(End of definition for \jot.)*

**\interdisplaylinepenalty**

```

```

The empty brace groups in front of the smashed box (which is placed by \finsm@sh) ensures that a \smash in math is not just producing a single box with its dimensions altered, but a box plus this second ord atom. The reason is that T<sub>E</sub>X sometimes reboxes

a box if its the only thing in a place like the denominator of a fraction. This would then undo the smashing and the additional ord atom prevents that. Two ord atoms in a row do not alter the horizontal spacing in a formula so this is otherwise transparent.

`\@eqnocr`) Here's the `eqnarray*` environment:

```
518 \let\@seqnocr=\@eqnocr
519 \@namedef{eqnarray*}{\protected\def\@eqnocr{\nonumber\@seqnocr}\eqnarray}
520 \@namedef{endeqnarray*}{\nonumber\endeqnarray}
(End of definition for \@seqnocr.)
```

`\lefteqn` `\lefteqn{FORMULA}` typesets FORMULA in display math style flushleft in a box of width zero.

```
521 \def\lefteqn#1{\rlap{$\displaystyle #1$}}
(End of definition for \lefteqn.)
```

`\ensuremath` In math mode, `\ensuremath{text}` is equivalent to `text`; in LR or paragraph mode, it is equivalent to `$text$`. `\relax` is not needed in front of the `\ifmmode` as `\protect` will be `\let` to `\relax`. This version (due to Donald Arseneau) avoids duplicating its argument in the ‘then’ and ‘else’ part of the `\ifmath` which is necessary in nested ‘tabular’ like environments. See `amslatex/2104`.

```
522 \DeclareRobustCommand{\ensuremath}{%
523   \ifmmode
524     \expandafter\@firstofone
525   \else
526     \expandafter\@ensuredmath

## 1.3 External options to the standard document classes

### 1.3.1 Left equation numbering

**\@eqnnum** To put the equation number on the left side of an equation we have to use a little trick. The number is shifted `\displaywidth` to the left inside a box of (approximately) zero width. This fails when the equation is too wide, the equation number than may overprint the equation itself.

```

547 <*\leqno>
548 \renewcommand\@eqnnum{\hb@xt@.01\p@{}}%
549                               \rlap{\normalfont\normalcolor
550                               \hskip -\displaywidth(\theequation)}}
551 </\leqno>

```

(End of definition for \@eqnnum.)

### 1.3.2 Flush left equations

To get the displayed math environments to print the contents flush left (with an indentation) we have to redefine all of L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub>'s displayed math environments.

**\mathindent** The amount of indentation of the equations is stored in a register.

```

552 <*\fleqn>
553 \newskip\mathindent

```

The setting of `\mathindent` has to be deferred until the class file has been processed, because `\leftmargini` is still 0pt wide at the moment `fleqn.clo` is read in.

```

554 \AtEndOfClass{\mathindent\leftmargini}

```

(End of definition for \mathindent.)

**\[** Begin display math;

# ltlists.dtx

## 1 List, and related environments

The generic commands for creating an indented environment – `enumerate`, `itemize`, `quote`, etc – are:

```
\list{<LABEL>}{<COMMANDS>} ... \endlist
```

which can be invoked by the user as the list environment. The LABEL argument specifies item labeling. COMMANDS contains commands for changing the horizontal and vertical spacing parameters.

Each item of the environment is begun by the command `\item[ITEMLABEL]` which produces an item labeled by ITEMLABEL. If the argument is missing, then the LABEL argument of the `\list` command is used as the item label.

The label is formed by putting `\makelabel{<ITEMLABEL>}` in an hbox whose width is either its natural width or else `\labelwidth`, whichever is larger. The `\list` command defines `\makelabel` to have the default definition:

```
\makelabel{<ARG>} == BEGIN \hfil ARG END
```

which, for a label of width less than `\labelwidth`, puts the label flushright, `\labelsep` to the left of the item's text. However, `\makelabel` can be `\let` to another command by the `\list`'s COMMANDS argument.

A `\usecounter{<foo>}` command in the second argument causes the counter *foo* to be initialized to zero, and stepped by every `\item` command without an argument. (`\label` commands within the list refer to this counter.)

When you leave a list environment, returning either to an enclosing list or normal text mode, LaTeX begins a new paragraph if and only if you leave a blank line after the `\end` command. This is accomplished by the `\@endparenv` command.

Blank lines are ignored every other reasonable place—i.e.:

- Between the `\begin{list}` and the first `\item`,
- Between the `\item` and the text of that item.
- Between the end of the last item and the `\end{list}`.

For an environment like quotation, in which items are not labeled, the entire environment is a single item. It is defined by letting `\quotation == \list{}{...}\item\relax`. (Note the `\relax`, there in case the first character in the environment is a '['.) The spacing parameters provide a great deal of flexibility in designing the format, including the ability to let the indentation of the first paragraph be different from that of the subsequent ones.

The trivlist environment is equivalent to a list environment whose second argument sets the following parameter values:

`\leftmargin = 0`: causes no indentation of left margin

`\labelwidth = 0`: see below for precise effect this has.

`\itemindent = 0`: with a null label, makes first paragraph have no indentation. Succeeding paragraphs have `\parindent` indentation. To give first paragraph same indentation, set `\itemindent = \parindent` before the `\item[]`.

Every `\item` in a `trivlist` environment must have an argument—in many cases, this will be the null argument (`\item[]`). The `trivlist` environment is mainly used for paragraphing environments, like `verbatim`, in which there is no margin change. It provides the same vertical spacing as the `list` environment, and works reasonably well when it occurs immediately after an `\item` command in an enclosing list.

## 1.1 List and Trivlist

The following variables are used inside a list environment:

`\totalleftmargin` The distance that the prevailing left margin is indented from the outermost left margin,

`\linewidth` The width of the current line. Must be initialized to `\hsize`.

`\listdepth` A count for holding current list nesting depth.

`\makelabel` A macro with a single argument, used to generate the label from the argument (given or implied) of the `\item` command. Initialized to `\mklab` by the `\list` command. This command must produce some stretch—i.e., an `\hfil`.

`@inlabel` A switch that is false except between the time an `\item` is encountered and the time that `TEX` actually enters horizontal mode. Should be tested by commands that can be messed up by the list environment's use of `\everypar`.

`\box\@labels` When `@inlabel = true`, it holds the labels to be put out by `\everypar`.

`@noparitem` A switch set by `\list` when `@inlabel = true`. Handles the case of a `\list` being the first thing in an item.

`@nopalist` A switch set true for a list that begins an item. No `\topsep` space is added before or after `\item`'s such a list.

`@newlist` Set true by `\list`, set false by the first text (by `\everypar`).

`@noitemarg` Set true when executing an `\item` with no explicit argument. Used to save space. To save time, make two separate `\@item` commands.

`@nbrlist` Set true by `\usecounter` command, causes list to be numbered.

`\listctr` `\def`'ed by `\usecounter` to name of counter.

`@noskipsec` A switch set true by a sectioning command when it is creating an in-text heading with `\everypar`.

Throughout a list environment, `\hsize` is the width of the current line, measured from the outermost left margin to the outermost right margin. Environments like `tabbing` should use `\linewidth` instead of `\hsize`.

Here are the parameters of a list that can be set by commands in the `\list's` `COMMANDS` argument. These parameters are all `TEX` skips or dimensions (defined by `\newskip` or `\newdimen`), so the usual `TEX` or `LATEX` commands can be used to set them. The commands will be executed in `vmode` if and only if the `\list` was preceded by a `\par` (or something like an `\end{list}`), so the spacing parameters can be set according to whether the list is inside a paragraph or is its own paragraph.

## 1.2 Vertical Spacing (skips)

`\topsep`: Space between first item and preceding paragraph.

`\partopsep`: Extra space added to `\topsep` when environment starts a new paragraph (is called in `vmode`).

`\itemsep`: Space between successive items.

`\parsep`: Space between paragraphs within an item – the `\parskip` for this environment.

## 1.3 Penalties

`\@beginparpenalty`: put at the beginning of a list

`\@endparpenalty`: put at end of list

`\@itempenalty`: put between items.

## 1.4 Horizontal Spacing (dimens)

`\leftmargin`: space between left margin of enclosing environment (or of page if top level list) and left margin of this list. Must be nonnegative.

`\rightmargin`: analogous.

`\listparindent`: extra indentation at beginning of every paragraph of a list except the one started by the `\item` command. May be negative! Usually, labeled lists have `\listparindent` equal to zero.

`\itemindent`: extra indentation added right BEFORE an item label.

`\labelwidth`: nominal width of box that contains the label. If the natural width of the label  $\leq \text{\labelwidth}$ , then the label is flushed right inside a box of width `\labelwidth` (with an `\hfil`). Otherwise, a box of the natural width is employed, which causes an indentation of the text on that line.

`\labelsep`: space between end of label box and text of first item.

## 1.5 Default Values

Defaults for the list environment are set as follows. First, `\rightmargin`, `\listparindent` and `\itemindent` are set to 0pt. Then, one of the commands `\@listi`, `\@listii`, ... , `\@listvi` is called, depending upon the current level of the list. The `\@list ...` commands should be defined by the document style. A convention that the document style should follow is to set `\leftmargin` to `\leftmargini`, ..., `\leftmarginvi` for the appropriate level. Items that aren't changed may be left alone, but everything that could possibly be changed must be reset. *Historical L<sup>A</sup>T<sub>E</sub>X 2.09 comments (not necessarily accurate any more)*:

121 \fi
122 }

```

(End of definition for `\endtrivlist`.)

`\@endparenv` To suppress the paragraph indentation in text immediately following a paragraph-making environment, `\everypar` is changed to remove the space, and `\par` is redefined to restore `\everypar`. Instead of redefining `\par` and `\everypar`, `\@endparenv` was changed to set the `@endpe` switch, letting `\end` redefine `\par` and `\everypar`.

This allows paragraph-making environments to work right when called by other environments. (Changed 27 Oct 86)

In 2024 this logic was partially replaced with a new algorithm:

- `\if@endpe` is now set globally to `true` or `false`.
- In addition `\@endpetrue` initiates an `\aftergroup` call to `\propagate@doendpe` if it is used inside a group.
- `\propagate@doendpe` in turn checks the status of `\if@endpe` and if that is `true` it calls `\@doendpe` otherwise it does nothing.
- `\@doendpe` in turn calls `\@endpetrue` and also makes the necessary changes to `\par` and `\everypar` so that they handle as before any empty line that follows the environment.
- Because of the `\@endpetrue` we get another `\aftergroup`, so the mechanism slowly migrates out of several groups if those follow immediately after the end of the environment. If, however, there is a new paragraph started or an explicit `\par` before the next group ends then this will result in a call to `\@endpefalse` and the migration stops (note that `\propagate@doendpe` is still called once after the group but does nothing).
- Using this approach something like

```

{% some customization here
\begin{equation}
x=y
\end{equation}}
some text

```

is still correctly identified as a paragraph continuation so that there is no indentation before `some text`.

- We can get away with using global settings of `\if@endpe` even in nested situations (without keeping track of the status in a stack), because the switch change is made only at the very end of such environments, basically directly before the `\endgroup` in `\end`, and it is later set back to `false` by the next `\everypar` or the next `\par`. Even if the environment is called without using `\begin \end`, the situation doesn't change (or rather cause a problem).
- However, there is one scenario where the new approach would change the behavior. If a box is being built, e.g., with `\setbox`, we have now the case that a `\@endpetrue` inside would migrate out into a context in which it should not be true (because the box might get used elsewhere, e.g., a float). In the past, due to local switch changes, that didn't happen, i.e., `\if@endpe` would revert to `false` at the end of the box definition.
- Thus, to avoid that one has to explicitly set it back to false at the end of such constructions, just as we also need to prevent colors from migrating out. Thus the correct place to do this is in `\color@endgroup` because that is always called at that point.

```

123 \def\@endparenv{%

144 <latexrelease>          {\@endpetrue}{New @endpe handling}%
145 \def\@endpefalse{\global\let\if@endpe\iffalse}
146 \def\@endpetrue {%
147   \global\let\if@endpe\iftrue

```

If we are inside a simple or a semi-simple group then propagate to the outside, for all other group types do nothing. Normally, we would start out in the group opened by `\begin` (type 14). When we migrate out of that we are either on top-level (type 0) or in another semi-simple group (type 14) or in some other group. Thus, the best order of tests is to first test for 14, then for 0 and finally for 1 (simple group).

```

148   \ifnum\currentgrouptype =14          % semi-simple group
149     \aftergroup\propagate@doendpe
150   \else
151     \ifnum\currentgrouptype =\z@      % no group: top-level
152     \else
153       \ifnum\currentgrouptype =\@ne  % simple group
154       \aftergroup\propagate@doendpe
155     \fi
156   \fi
157 \fi
158 }

```

If `\if@endpe` is still true after the group ends, we run `\@doendpe` that in turn runs another `\@endpetrue` (besides other things), thus propagating further if necessary. However, if the endpe situation got resolved and `\if@endpe` is false then nothing further happens.

```

211   \everypar{%
212     \@minipagefalse
213     \global\@newlistfalse
```

This `\if@inlabel` check is needed in case an item starts of inside a group so that `\everypar` does not become empty outside that group.

```
214   \if@inlabel
215     \global\@inlabelfalse
```

The paragraph indent is now removed by using `\setbox...` since this makes `\noindent` a no-op here, as it should be. Thus the following comment is redundant but is left here for the sake of future historians: this next command was changed from an `hskip` to a kern to avoid a break point after the `parindent` box: the skip could cause a line-break if a very long label occurs in `raggedright` setting. If `\noindent` was used after `\item` want

to cancel the `\itemindent` skip. This case can be detected as the indentation box will be void.

```

216      {\setbox\z@\lastbox
217       \ifvoid\z@
218        \kern-\itemindent
219       \fi}%
220      \box\@labels
221      \penalty\z@
222      \fi

```

This code is intended to prevent a page break after the first line of an item that comes immediately after a section title. It may be sensible to always forbid a page break after one line of an item? As with all such settings of `\clubpenalty` it is local so will have no effect if the item starts in a group.

Only resetting `@nobreak` when it is true is now essential since now it is sometimes set locally.

```

223      \if@nobreak
224        \@nobreakfalse
225        \clubpenalty \@M
226      \else

## 1.6 Itemize and Enumerate

Enumeration is done with four counters: `enumi`, `enumii`, `enumiii` and `enumiv`, where `enumN` controls the numbering of the Nth level enumeration. The label is generated by the commands `\labelenumi ... \labelenumiv`, which should be defined by the document style. Note that `\p@enumN\theenumN` defines the output of a `\ref` command. A typical definition might be:

```
\def\theenumii{\alph{enumii}}
\def\p@enumii{\theenumi}
\def\labelenumii{(\theenumii)}
```

which will print the labels as ‘(a)’, ‘(b)’, ... and print a `\ref` as ‘3a’.

The item numbers are moved to the right of the label box, so they are always a distance of `\labelsep` from the item.

`\@enumdepth` holds the current enumeration nesting depth.

Itemization is controlled by four commands: `\labelitemi`, `\labelitemii`, `\labelitemiii`, and `\labelitemiv`. To cause the second-level list to be bulleted, you just define `\labelitemii` to be `•`. `\@itemspacing` and `\@itemdepth` are the analogs of `\@enumspacing` and `\@enumdepth`.

`\makebox` `\makebox[ $\langle wid \rangle$ ][ $\langle pos \rangle$ ]{ $\langle obj \rangle$ }`  
Puts  $\langle obj \rangle$  in an `\hbox` of width  $\langle wid \rangle$ , positioned by  $\langle pos \rangle$ .  
The possible  $\langle pos \rangle$  are:  
s stretched,  
l flushleft,  
r flushright,  
c (default) centred.  
If  $\langle wid \rangle$  is missing, then  $\langle pos \rangle$  is also missing and  $\langle obj \rangle$  is put in an `\hbox` of its natural width.  
`\makebox( $\langle x \rangle$ , $\langle y \rangle$ )[ $\langle pos \rangle$ ]{ $\langle obj \rangle$ }`  
Puts  $\langle obj \rangle$  in an `\hbox` of width  $x * \text{\unitlength}$  and height  $y * \text{\unitlength}$ .  
 $\langle pos \rangle$  arguments are s, l, r or c (default) for stretched, flushleft, flushright or centred, and t or b for top, bottom – or combinations like tr or rb. Default for horizontal and vertical are centered. Note that in this picture mode version of `\makebox` a [b] aligns on the *bottom* of the text as documented. If you want to align on the *baseline* use `\makebox( , ) [b]{\raisebox{0pt}{\height}[0pt]{xyz}}` or `\makebox( , ) [b]{\smash{xyz}}`  
`\mbox` `\mbox{ $\langle obj \rangle$ }` The same as `\makebox{ $\langle obj \rangle$ }`, but is more efficient as no checking for optional arguments is done.  
`\newsavebox` `\newsavebox{ $\langle cmd \rangle$ }` : If  $\langle cmd \rangle$  is undefined, then defines it to be a T<sub>E</sub>X box register.  
`\savebox` `\savebox{ $\langle cmd \rangle$ }` ... :  $\langle cmd \rangle$  is defined to be a T<sub>E</sub>X box register, and the ‘...’ are any `\makebox` arguments. It is like `\makebox`, except it doesn’t produce text but saves the value in `\box  $\langle cmd \rangle$` .  
`\sbox` `\sbox{ $\langle cmd \rangle$ }{ $\langle obj \rangle$ }` is an efficient abbreviation for `\savebox{ $\langle cmd \rangle$ }{ $\langle obj \rangle$ }`.  
`lrbox (env.)` `\begin{lrbox}{ $\langle cmd \rangle$ }\text{\end{lrbox}}` is equivalent to `\sbox{ $\langle cmd \rangle$ }{ $\langle text \rangle$ }` except that any white space at the beginning and end of  $\langle text \rangle$  is ignored.  
`\framebox` `\framebox ...` : like `\makebox`, except it puts a ‘frame’ around the box. The frame is made of lines of thickness `\fboxrule`, separated by space `\fboxsep` from the text – except for `\framebox(X,Y) ...`, where the thickness of the lines is as for the picture environment, and there is no separation added.  
`\fbox` `\fbox{ $\langle obj \rangle$ }` is an abbreviation for `\framebox{ $\langle obj \rangle$ }`.  
`\parbox` `\parbox[ $\langle pos \rangle$ ][ $\langle height \rangle$ ][ $\langle inner-pos \rangle$ ]{ $\langle width \rangle$ }{ $\langle text \rangle$ }` : Makes a box with `\hsize  $\langle width \rangle$` , positioned by  $\langle pos \rangle$  as follows: c : `\vcenter` (placed in  $\$...\$$  if not in math mode) b : `\vbox` t : `\vtop` default value is c. Sets `\hsize :=  $\langle width \rangle$`  and calls `\@parboxrestore`, which does the following: Restores the original definitions of:  
`\par`  
`\`  
`\-`  
`\,`  
`\‘`  
`\=`

```

Resets the following parameters:
\parindent      = 0pt
\parskip        = 0pt
\linewidth      = \hsize
\@totalleftmargin = 0pt
\leftskip       = 0pt
\rightskip      = 0pt
\@rightskip     = 0pt
\parfillskip    = 0pt plus 1fil
\lineskip       = \normallineskip
\baselineskip   = \normalbaselineskip
Calls \sloppy
Note: \arrayparboxrestore same as \@parboxrestore but it doesn't restore \.
minipage (env.) minipage : Similar to \parbox, except it also makes this look like a page by setting
\textwidth == \columnwidth == box width
changes footnotes by redefining:
\@mpfn == mpfootnote
\thempfn == \thempfootnote
\@footnotetext == \@mpfootnotetext
resets the following list environment parameters:
\@listdepth == \@mplistdepth
where \@mplistdepth is initialized to zero,
and executes \@minipagerestore to allow the document style to reset any other
parameters it desires. It sets @minipage true, and resets \everypar to set it false. This
switch keeps \addvspace from putting space at the top of a minipage.
Change added 24 May 89: \minipage sets @minipage globally; \endminipage resets
it false.
\rule \rule[\langle raised \rangle]{\langle width \rangle}{\langle height \rangle} : Makes a \langle width \rangle * \langle height \rangle rule, raised
\langle raised \rangle.
\underline \underline{\langle text \rangle} : Makes an underlined hbox with \langle text \rangle in it.
\raisebox \raisebox{\langle distance \rangle}[\langle height \rangle][\langle depth \rangle]{\langle box \rangle} :
Raises \langle box \rangle up by \langle distance \rangle length (down if \langle distance \rangle negative). Makes TEX think
that the new box extends \langle height \rangle above the line and \langle depth \rangle below, for a total vertical
length of \langle height \rangle + \langle depth \rangle. Default values of \langle height \rangle & \langle depth \rangle = actual height and
depth of box in new position.

**\@arrayparboxrestore** Restore various paragraph parameters.

The rational for allowing two normally global flags to be set locally here was stated originally by Donald Arseneau and extended by Chris Rowley. It is because these flags are only set globally to true by section commands, and these should never appear within boxes or, indeed, in any group; and they are only ever set globally to false when they are definitely true.

If anyone is unhappy with this argument then both flags should be treated as in \@setnobreak; otherwise this command will be redundant.

\@finalstrut This macro adds a special strut the *depth* of the box given as #1, and height and width Opt. It is used for ensuring that the last line of a paragraph has the correct depth in ‘p’ columns of tables and in footnotes. In vertical mode nothing is done, as adding the strut (as done in 2.09) would start a new paragraph. It would be possible to inspect \prevdepth to check the depth of the just-completed paragraph, but we do not do that here. Actually we do even less now, skip the vmode test as it broke tabular ‘p’ columns.

The \nobreak was added (1995/10/31) to allow hyphenation of the final word of the paragraph.

In 2024 we changed the macro to account for vertical mode. In that case we use a strut produced with \hrule to avoid starting a new paragraph (resulting in spurious extra line) and also account for the \prevdepth of the previous line.

```

## 1.1 Some low-level constructs

The following commands are basically inherited from plain T<sub>E</sub>X.

`\leftline` These macros place text on a full line either centred or left or right adjusted.

`\rightline` 614 `\def\@@line{\hb@xt@\hsize}`

`\centerline` 615 `\DeclareRobustCommand\leftline[1]{\@@line{#1\hss}}`

`\@@line` 616 `\DeclareRobustCommand\rightline[1]{\@@line{\hss#1}}`

617 `\DeclareRobustCommand\centerline[1]{\@@line{\hss#1\hss}}`

*(End of definition for \leftline and others.)*

`\rlap` These macros place text to the left or right of the current reference point without taking up space.

`\llap` 618 `\DeclareRobustCommand\rlap[1]{\hb@xt@\z@{#1\hss}}`

`\clap` 619 `\DeclareRobustCommand\llap[1]{\hb@xt@\z@{\hss#1}}`

And here is the version that centers, it was initially introduced by `mathtools`.

```
620 \DeclareRobustCommand\clap[1]{\hb@xt@\z@{\hss#1\hss}}
```

*(End of definition for \rlap, \llap, and \clap.)*

```
621 </2ekernel>
```

## File 41

# lftab.dtx

## 1 Tabbing, Tabular and Array Environments

This section deals with ‘Lining It Up in Columns’. First the `tabbing` environment is defined, and then in second part, `tabular` together with its variants, `tabular*` and `array`.

Note that the `tabular` defined here is essentially the original L<sup>A</sup>T<sub>E</sub>X 2.09 version, not the extended version described in *The L<sup>A</sup>T<sub>E</sub>X Companion*. Use the `array` package to obtain the extended version.

### 1.1 tabbing

*Historical L<sup>A</sup>T<sub>E</sub>X 2.09 comments (not necessarily accurate any more):*

`\dimen(\@firsttab + i)` = distance of tab stop `i` from left margin  
0 <= `i` <= 15 (?).

`\dimen\@firsttab` is initialized to `\@totalleftmargin`, so it starts  
at the prevailing left margin.

`\@maxtab` = number of highest defined tab register  
probably = `\@firsttab + 12`

`\@nxttabmar` = tab stop number of next line’s left margin

`\@curtabmar` = tab stop number of current line’s left margin

`\@curtab` = number of the current tab. At start of line,  
it equals `\@curtabmar`

`\@hightab` = largest tab number currently defined.

`\@tabpush` = depth of `\pushtab`’s

`\box\@curline` = contents of current line, excluding left margin  
skip, and excluding contents of current field

`\box\@curfield` = contents of current field

`@rjfield` = switch: T iff the last field of the line should  
be right-justified at the right margin.

`\tabbingsep` = distance left by the `\’` command between the  
current position and the field that is  
“left-shifted”.

#### UTILITY MACROS

`\@stopfield` : closes the current field

`\@addfield` : adds the current field to the current line.

`\@contfield` : continues the current field

`\@startfield` : begins the next field

`\@stopline` : closes the current line and outputs it

```

## 1.2 array and tabular environments

*Historical L<sup>A</sup>T<sub>E</sub>X 2.09 comments (not necessarily accurate any more):*

### ARRAY PARAMETERS:

`\arraycolsep`  
: half the width separating columns in an array environment  
`\tabcolsep`  
: half the width separating columns in a tabular environment  
`\arrayrulewidth`  
: width of rules  
`\doublerulesep`  
: space between adjacent rules in array or tabular  
`\arraystretch`  
: line spacing in array and tabular environments is done by placing a strut in every row of height and depth `\arraystretch` times the height and depth of the strut produced by an ordinary `\strut` command.

### PREAMBLE:

The PREAMBLE argument of an array or tabular environment can contain the following:

`l,r,c` : indicate where entry is to be placed.  
`|` : for vertical rule  
`@{EXP}` : inserts the text EXP in every column.  
`\arraycolsep` or `\tabcolsep` spacing is suppressed.  
`*{N}{PRE}` : equivalent to writing N copies of PRE in the preamble.  
PRE may contain `*{N'}{EXP'}` expressions.  
`p{LEN}` : makes entry in parbox of width LEN.

### SPECIAL ARRAY COMMANDS:

`\multicolumn{N}{FORMAT}{ITEM}` : replaces the next N column items by ITEM, formatted according to FORMAT. FORMAT should contain at most one l,r or c. If it contains none, then ITEM is ignored.

`\vline` : draws a vertical line the height of the current row. May appear in an array element entry.

`\hline` : draws a horizontal line between rows. Must appear either before the first entry (to appear above the first row) or right after a `\\` command. If followed by another `\hline`, then adds a `\vskip` of `\doublerulesep`.

`\cline{i-j}` : draws horizontal lines between rows covering columns i through j, inclusive. Multiple commands may follow one another to provide lines covering several disjoint columns

`\extracolsep{WIDTH}` : for use inside an @ in the preamble. Causes a WIDTH space to be added between columns for the rest of the columns. This is in addition to the ordinary intercolumn space.

```

\array ==
  BEGIN
    \@acol    == \@arrayacol
    \@classz  == \@arrayclassz
    \@classiv == \@arrayclassiv
    \\        == \@arraycr
    \@halignto == NULL
    \@tabarray
  END

\endarray{NAME} == BEGIN \crrc }} END

\tabular ==

`\@tabarray` RmS 91/11/04 added `\m@th`.

```
181 \def\@tabarray{\m@th\@ifnextchar[\@array{\@array[c]}}
```

*(End of definition for \@tabarray.)*

RmS 1993/11/03 changed `\halign` to `\ialign` and removed superfluous `\tabskip` assignment

`\@array`

```
182 \def\@array[#1]#2{%
```

```
183 \if #1t\top \else \if#1b\bottom \else \vcenter \fi\fi
```

184    **\bgroup**

This next bit of code sets up the strut and then builds the halign and its preamble according to the specification in the second argument.

This code has been moved inside the box. A side effect of this has been to expose what was a buglet in the previous version: since the `\@arstrut` below is expanded and contains an `\ifmmode` then it could produce an unnecessary extra box in every row, thus wasting ‘lots of’ main memory.

```
185    \setbox\@arstrutbox\hbox{%
186      \vrule \@height\arraystretch\ht\strutbox
187        \@depth\arraystretch \dp\strutbox
188        \@width\z@}%
189    \@mkpream{#2}%
190    \edef\@preamble{%
191      \ialign \noexpand\@halignto
192        \bgroup \@arstrut \@preamble \tabskip\z@skip \cr}%
```

That is the end of setting up the preamble; now we reset things before executing the halign built-up in `\@preamble`. The restorations could be done by introducing an extra group, thus saving tokens.

```
193    \let\@startpbox\@startpbox \let\@endpbox\@endpbox
194    \let\@tabularnewline\%
195    \def\par{\ifnum\currentgrouptype=6 \else\@@par\fi}%
196    \let\@sharp##%
197    \set@typeset@protect
198    \lineskip\z@skip\baselineskip\z@skip
```

If the parsing of the preamble goes wrong there may be some characters left which  $\mathrm{T}_{\mathrm{E}}\mathrm{X}$  then tries to typeset, i.e., we would be in horizontal mode. That would produce an endless loop because the `\halign` expects vertical mode thus issues a `\par` but that is a no-op at this point. So we better test this case issue some error message and make a crude recovery by ending that horizontal mode with force. A better fix would be to ensure that we never pick up more than a single character token (not done).

```
199    \ifhmode \@preamerr\z@ \@@par\fi
200    \@preamble}
```

*(End of definition for \@array.)*

**\@arraycr**    Array version of `\@array`.

```

`\multicolumn` *Historical L<sup>A</sup>T<sub>E</sub>X 2.09 comments (not necessarily accurate any more):*

```

\multicolumn{NUMBER}{FORMAT}{ITEM} ==
BEGIN
\multispan{NUMBER}
\begingroup
\@addamp == null
\@mkpream{FORMAT}
\@sharp == ITEM
\protect == \relax
\@startpbox == \@startpbox
\@endpbox == \@endpbox
\@arstrut
\@preamble
\endgroup
END

```

*End of historical L<sup>A</sup>T<sub>E</sub>X 2.09 comments.*

The command `\def\@addamp{}` was removed from `\multicolumn` on 6 Dec 86 because it caused embedded array environments not to work. I think that it was included originally to prevent an error message if the 2nd argument to the `\multicolumn` command had two column specifiers.

8 Feb 89 — `\hbox{}` added after `\@preamble` to correct bug that occurred if `\multicolumn` preceded `\\[D]` with  $D > 0$ , caused by `\\[]` command doing an `\unskip`, which removed `\tabcolsep` glue inserted by `\multicolumn`.

This has been made long so that, for example, a p-column can contain multiple paragraphs; maybe the arguments of @-expressions should also be able to contain multiple paragraphs.

```

233 \long\def\multicolumn#1#2#3{\multispan{#1}\begingroup

237   \@arstrut \@preamble\hbox{\endgroup\ignorespaces}

```

*(End of definition for \multicolumn.)*

*Historical L<sup>A</sup>T<sub>E</sub>X 2.09 comments (not necessarily accurate any more):*

Codes for classes and character numbers of array, tabular and multicolumn arguments.

Character	Class	Number
c	0	0
l	0	1
r	0	2
	1	-
@	2	-
p	3	-
{@-exp}	4	-
{p-arg}	5	-

`\@testpach \foo` : expands `\foo`, which should be an array parameter

token, and sets \@chclass and \@chnum to its class and number. Uses \@lastchclass to distinguish 4 and 5

Preamble error codes

0: 'illegal character'  
 1: 'Missing @-exp'  
 2: 'Missing p-arg'

```

`\cline` The old L<sup>A</sup>T<sub>E</sub>X2.09 implementation of `\cline` used up quite a lot of memory and two precious count registers. This new (1995/09/14) implementation does not use any count registers. It is coded in a way that depends heavily on the definition of `\multispan` so that command has been moved here from the file `ltplain.dtx`.

These counters are no longer declared.

`\newcount\@cla`

`\newcount\@clb`

367 `\def\cline#1{\@cline#1\@nil}`

368 `\def\@cline#1-#2\@nil{%`

369 `\omit`

Use the counter from `\multispan`.

370 `\@multicnt#1%`

371 `\advance\@multispan\m@ne`

372 `\ifnum\@multicnt=\@ne\@firstofone{&\omit}\fi`

373 `\@multicnt#2%`

374 `\advance\@multicnt-#1%`

375 `\advance\@multispan\@ne`

The original had `\unskip` at this point, but how could a skip get here ???

376 `\leaders\hrule\@height\arrayrulewidth\hfill`

377 `\cr`

This is back spacing is fairly horrible, but it is what happened in the old version... An alternative would be to make `\cline` look ahead for a following `\cline` as does `\hline`. This would alter the spacing in existing documents so keep the old version in the kernel. Perhaps a package should do this differently.

378 `\noalign{\vskip-\arrayrulewidth}}`

*(End of definition for `\cline` and `\@cline`.)*

`\mscount` The `\mscount` counter is no longer declared, saving a csname and a register. It is declared in compatibility mode.

*(End of definition for `\mscount`.)*

`\multispan` Modify `\multispan` slightly from its plain T<sub>E</sub>X definition to allow more efficient code sharing with `\multicolumn`. Also share a count register with `\multipt`.

`\@multispan` `\sp@n` 379 `\def\multispan{\omit\@multispan}`

380 `\def\@multispan#1{%`

381 `\@multicnt#1\relax`

382 `\loop\ifnum\@multicnt>\@ne \sp@n\repeat}`

383 `\def\sp@n{\span\omit\advance\@multicnt\m@ne}`

*(End of definition for `\multispan`, `\@multispan`, and `\sp@n`.)*

`\@startpbox` Helper macros for ‘p’ columns.

`\@endpbox` `\@startpbox{<width>} text \egroup` is essentially `\parbox{<width>}{<text>}`

`\@endpbox` is essentially `\unskip \strut \par \egroup\hfil` (Changed 14 Jan 89) (changed again 1994/05/13)

384 `\def\@startpbox#1{\vtop\bgroup \setlength\hsize{#1}\@arrayparboxrestore}`

```
385 \def\@endpbox{\@finalstrut\@arstrutbox\par\egroup\hfil}
```

14 Jan 89: Def of \@endpbox changed from  
`\def\@endpbox{\par\vskip\dp\@arstrutbox\egroup\hfil}`  
so vertical spacing works out right if the last line of a ‘p’ entry has a descender.

*(End of definition for \@startpbox and \@endpbox.)*

```

## File 42

# ltpictur.dtx

## 1 Picture Mode

Picture mode commands. In addition to the commands available in L<sup>A</sup>T<sub>E</sub>X 2.09, This section adds the new `\qbezier` command for drawing curves.

`\qbezier`     `\qbezier[N](AX,AY)(BX,BY)(CX,CY)` plots a quadratic Bezier curve from (*AX,AY*) to (*CX,CY*), with (*BX,BY*) as the third Bezier point, using *N*+1 points equally spaced parametrically. If *N* = 0 (the default value), then a sufficient number of points are used to draw a connected curve—except that at most `\qbeziermax`+1 points are drawn. A “point” is a square of side `\@wholewidth`.

`\bezier`     In addition, to be compatible with the old `bezier` package, a variant of this command, `\bezier`, is defined, in which the first argument is not optional.

*Historical L<sup>A</sup>T<sub>E</sub>X 2.09 comments (not necessarily accurate any more):*

<code>\unitlength</code>	= value of dimension argument
<code>\@wholewidth</code>	= current line width
<code>\@halfwidth</code>	= half of current line width
<code>\@linefont</code>	= font for drawing lines
<code>\@circlefont</code>	= font for drawing circles

`\linethickness{DIM}` : Sets the width of horizontal and vertical lines in a picture to DIM. Does not change width of slanted lines or circles. Width of all lines reset by `\thinlines` and `\thicklines`

```
\picture(XSIZE,YSIZE)(XORG,YORG)
  BEGIN
    \@picht :=L YSIZE * \unitlength

```

`\@defaultunitsset` Set a length register, #1, accepting number or an etex length expression, #2, with default unit, #3.

The register name in #1 can be prefixed by `\advance` so that the register is incremented by the supplied value.

`\@defaultunitsset{\advance\@vxx}{\textwidth-15pt}\unitlength`

#3 can be a literal unit such as `cm` or a length register such as `\unitlength`.

This is used in all `picture` commands that take picture coordinates. So `\put(2,2)` as previously but now `\put(\textwidth-5cm,0.4\textheight)` Note that you can only use expressions with lengths, `\put(1+2,0)` is not supported.

```

*Historical L<sup>A</sup>T<sub>E</sub>X 2.09 comments (not necessarily accurate any more):*

## CIRCLES AND OVALS

### USER COMMANDS:

`\circle{D}` : Produces the circle with the diameter as close as possible to  $D * \text{\unitlength}$ . `\put(X,Y){\circle{D}}` puts the circle with its center at (X,Y).

`\oval(X,Y)` : Makes an oval as round as possible that fits in the rectangle of width  $X * \text{\unitlength}$  and height  $Y * \text{\unitlength}$ . The reference point is the center.

`\oval(X,Y)[POS]` : Same as `\oval(X,Y)` except it draws only the half or quadrant of the oval indicated by POS. E.G., `\oval(X,Y)[t]` draws just the top half and `\oval(X,Y)[br]` draws just the bottom right quadrant. In all cases, the reference point is the same as the unqualified `\oval(X,Y)` command.

`\@ovvert {DELTA1} {DELTA2}` : Makes a vbox containing either the left side or the right side of the oval being constructed. The baseline will coincide with the outside bottom edge of the oval; the left side of the box will coincide with the left edge of the vertical

rule. The width of the box will be `\@tempdima`.  
`DELTA1` and `DELTA2` are added to the character number in `\@tempcnta`  
to get the characters for the top and bottom quarter circle pieces.

`\@ovhorz` : Makes an hbox containing the straight rule for either the  
top or the bottom of the oval being constructed. The baseline  
will coincide with bottom edge of the rule; the left side of  
the box will coincide with the left side of the oval.  
The width of the box will be `\@ovxx`.

`\@getcirc {DIAM}` : Sets `\@tempcnta` to the character number  
of the top-right quarter circle with the largest  
diameter less than or equal to `DIAM`.  
Sets `\@tempboxa` to an hbox containing that character.  
Sets `\@tempdima` to `\wd \@tempboxa`, which is the distance  
from the circle's left outside edge to its right  
inside edge.  
(These characters are like those described in the  
TeXbook, pp. 389-90.)

## 1.1 Curves

The new `\qbezier` command, based on the old `\bezier` defined in `bezier.sty`.  
*Historical L<sup>A</sup>T<sub>E</sub>X 2.09 comments (not necessarily accurate any more):*

```

\qbezier[N] == \bezier{N}

\bezier{N}(AX,AY)(BX,BY)(CX,CY) ==
BEGIN
  IF N = 0
  THEN \@xdima := |BX - AX|
      \@xb := |CX - BX|
      \@xa := Max(\@xa, \@xb)
      \@ya := |BY - AY|
      \@yb := |CY - BY|
      \@ya := Max(\@ya, \@yb)
      @sc := Max(\@xa, \@ya)
      %% The coefficient .5 below is the degree of overlap of
      %% successive points, where 1 is no overlap and 0 is

```

```

%% complete overlap. A coefficient of C multiplies
%% the number of points plotted by 1/C.
%%
\@xa := .5 * \@halfwidth
@sc := @sc / \@halfwidth
@sc := Max(@sc, qbeziermax)
ELSE @sc := N
@scp := @sc+1
\@xb := 2 * (BX - AX) * \unitlength
\@xa := ((CX-AX)*\unitlength - \@xb)/@sc
\@yb := 2 * (BY - AY) * \unitlength
\@ya := ((CY-AY)*\unitlength - \@yb)/@sc
\@pictdot := square rule of width \@wholewidth
\count@ := 0
WHILE \count@ < @scp
DO \@xdim := ((\count@*\@xa + @xb) / @sc) * \count@
\@ydim := ((\count@*\@ya + @yb) / @sc) * \count@
plot pt with relative coords (\@xdim,\@ydim)
\count@ := \count@+1
OD

```

*End of historical L<sup>A</sup>T<sub>E</sub>X 2.09 comments.*

**\qbeziermax** The maximum number of points to plot.

```

680 \def\qbeziermax{500}

```

*(End of definition for \qbeziermax.)*

In the code below, to save registers \@a ... are not used. Instead other registers are reused.

```

\newcounter{@sc} -> \c@multicnt
\newcounter{@scp} -> \@tempcnta
\newdimen\@xa -> \@ovxx
\newdimen\@xb -> \@ovdx
\newdimen\@ya -> \@ovyy
\newdimen\@yb -> \@ovdy
\newsavebox{\@pictdot} -> \@tempboxa

```

**\qbezier** Main user-level command to plot quadratic bezier curves. #2 should be (. .

```

681 \newcommand\qbezier[2][0]{\bezier{#1}#2}

```

*(End of definition for \qbezier.)*

**\bezier** Form of \bezier compatible with 2.09 bezier.sty, but modified to ignore spaces between its arguments. #2 should be white space, and #4 should be (. .

```

682 \def\bezier#1#2(#3)#4({\@bezier#1)(#3){}

# ltthm.dtx

## 1 Theorem Environments

The user creates his own theorem-like environments with the command

`\newtheorem{<name>}{<text>}[<counter>]` or

`\newtheorem{<name>}[<oldname>]{<text>}`

This defines the environment `<name>` to be just as one would expect a theorem environment to be, except that it prints `<text>` instead of “Theorem”.

If `<oldname>` is given, then environments `<name>` and `<oldname>` use the same counter, so using a `<name>` environment advances the number of the next `<name>` environment, and vice-versa.

If `<counter>` is given, then environment `<name>` is numbered within `<counter>`.

E.g., if `<counter> = subsection`, then the first `<name>` in subsection 7.2 is numbered `<text> 7.2.1`.

The way `<name>` environments are numbered can be changed by redefining `\the<name>`.  
*Historical L<sup>A</sup>T<sub>E</sub>X 2.09 comments (not necessarily accurate any more):*

### DOCUMENT STYLE PARAMETERS

`\@thmcounter{COUNTER}` : A command such that

`\edef\theCOUNTER{\@thmcounter{COUNTER}}`

defines `\theCOUNTER` to produce a number for a theorem environment.

The default is:

`BEGIN \noexpand\arabic{COUNTER} END`

`\@thmcountersep` : A separator placed between a theorem number and the number of the counter within which it is numbered.

E.g., to make the third theorem of section 7.2 be numbered 7.2-3, `\@thmcountersep` should be `\def`'ed to `'-'`. Its default is `''`.

`\@begintheorem{NAME}{NUMBER}` : A command that begins a theorem environment for a 'theorem' named 'NAME NUMBER' –

e.g., `\@begintheorem{Lemma}{3.7}` starts Lemma 3.7.

`\@opargbegintheorem{NAME}{NUMBER}{OPARG}` :

A command that begins a theorem environment for a 'theorem' named 'NAME NUMBER' with optional argument OPARG – e.g., `\@begintheorem{Lemma}{3.7}{Jones}` starts 'Lemma 3.7 (Jones)':.

`\@endtheorem` : A command that ends a theorem environment.

`\newtheorem{NAME}{TEXT}[COUNTER] ==`

`BEGIN`

if `\NAME` is definable

```

then \@definecounter{NAME}
  if COUNTER present
    then \@newctr{NAME}[COUNTER] fi
    \theNAME == BEGIN \theCOUNTER \@thmcountersep
                                eval\@thmcounter{NAME} END
    else \theNAME == BEGIN eval\@thmcounter{NAME} END
    \NAME == \@thm{NAME}{TEXT}
    \endNAME == \@endtheorem
  else error
fi
END

\newtheorem{NAME}[OLDNAME]{TEXT}==
BEGIN
  if counter OLDNAME nonexistent
  then ERROR
  else
    if \NAME is definable
    then BEGIN
      \theNAME == \theOLDNAME
      \NAME == \@thm{OLDNAME}{TEXT}
      \endNAME == \@endtheorem
      END
    else error
    fi
  fi
END

\@thm{NAME}{TEXT} ==
BEGIN
  \refstepcounter{NAME}
  if next char = [
    then \@ythm{NAME}{TEXT}
    else \@xthm{NAME}{TEXT}
  fi
END

\@xthm{NAME}{TEXT} ==
BEGIN
  \@begintheorem{TEXT}{\theNAME}
  \ignorespaces
END

\@ythm{NAME}{TEXT}[OPARG] ==
BEGIN
  \@opargbegintheorem{TEXT}{\theNAME}{OPARG}
  \ignorespaces
END

```

*End of historical L<sup>A</sup>T<sub>E</sub>X 2.09 comments.*

`\newtheorem` `\newtheorem` ought really be allowed only in the preamble Which would be good document style, and allow some main memory to be saved by declaring these commands to be `\onlypreamble`. Unfortunately the L<sup>A</sup>T<sub>E</sub>X book indicates that `\newtheorem` may be used anywhere in the document...

# ltsect.dtx

## 1 Sectioning Commands

This file defines the declarations such as `\author` which are used by `\maketitle`. `\maketitle` itself is defined by each class, not in the L<sup>A</sup>T<sub>E</sub>X kernel.

The second part of the file defines the generic commands used for defining sectioning commands such as `\chapter`. Again the actual document level commands are defined in the class files, in terms of these commands.

```
1 <*2ekernel>
2 \message{title,}
```

### 1.1 The Title

`\title` The user defines the title and author by the declarations `\title{<name>}`, `\author{<name>}`  
`\author` Similarly the date is declared with `\date{<date>}`.  
`\date` Inside these, the `\thanks{<footnote text>}` command may be used to make acknowl-  
`\thanks` edgements, notice of address, etc. in a footnote. If there are multiple authors, they have  
`\and` to be separated with the `\and` command.  
`\maketitle` And finally, the `\maketitle` command produces the actual title, using the informa-  
tion previously saved with the other commands.

```
3 </2ekernel>
4 <*2ekernel | latexrelease>
5 <latexrelease>\IncludeInRelease{2019/10/01}%
6 <latexrelease>                {\title}{Make commands robust}%
```

**\title** `\title` for use in `\maketitle`. If not given `\maketitle` will produce an error message.

```
7 \DeclareRobustCommand\title[1]{\gdef\@title{#1}}
```

*(End of definition for \title. This function is documented on page 819.)*

`\author` `\author` for use in `\maketitle`. If not given `\maketitle` will produce a warning message.

```
8 \DeclareRobustCommand*\author[1]{\gdef\@author{#1}}
```

*(End of definition for \author.)*

`\date` `\date` for use in `\maketitle`. If not given `\maketitle` will produce `\today` as the default.

```
9 \DeclareRobustCommand*\date[1]{\gdef\@date{#1}}
```

*(End of definition for \date.)*

`\thanks`

```
10 \DeclareRobustCommand\thanks[1]{\footnotemark
11     \protected@xdef\@thanks{\@thanks
12         \protect\footnotetext[\the\c@footnote]{#1}}%
13 }
```

*(End of definition for \thanks.)*

`\and`

```
14 \DeclareRobustCommand\and{%    % \begin{tabular}
15   \end{tabular}}%
16   \hskip 1em \@plus.17fil%
17   \begin{tabular}[t]{c}}%      % \end{tabular}
```

*(End of definition for \and.)*

```
18 </2ekernel | latexrelease>
19 <latexrelease>\EndIncludeInRelease
20 <latexrelease>\IncludeInRelease{0000/00/00}%
21 <latexrelease>                {\title}{Make commands robust}%
22 <latexrelease>
23 <latexrelease>\kernel@make@fragile\title
24 <latexrelease>\kernel@make@fragile\author
25 <latexrelease>\kernel@make@fragile\date
26 <latexrelease>\kernel@make@fragile\thanks
27 <latexrelease>\kernel@make@fragile\and
28 <latexrelease>
29 <latexrelease>\EndIncludeInRelease
30 <*2ekernel>
```

`\@title`

```
31 \def\@title{\@latex@error{No \noexpand\title given}\@ehc}
```

*(End of definition for \@title.)*

`\@author`

```
32 \def\@author{\@latex@warning@no@line{No \noexpand\author given}}
```

*(End of definition for \@author.)*

`\@date`

```
33 \gdef\@date{\today}
```

*(End of definition for \@date.)*

`\@thanks`

```
34 \let\@thanks\@empty
```

*(End of definition for \@thanks.)*

```
35 \message{sectioning,}
```

## 1.2 Sectioning

`\@secpenalty`

```
36 \newcount\@secpenalty
37 \@secpenalty = -300
```

*(End of definition for \@secpenalty.)*

`\if@noskipsec` Way back in 1991 (08/26) FMi & RmS set the `@noskipsec` switch to true for the preamble  
`\@noskipsectrue` and to false in `\document`. This was done to trap lists and related text in the preamble  
but it does not catch everything.

```
38 \newif\if@noskipsec \@noskipsectrue
```

(End of definition for \if@noskipsec and \@noskipsectrue.)

`\@startsection` The `\@startsection{<name>}{<level>}{<indent>}{<beforeskip>}{<afterskip>}{<style>}*[<altheading>]{<heading>}` command is the mother of all the user level sectioning commands. The part after the `*`, including the `*` is optional.

**name:** e.g., 'subsection'

**level:** a number, denoting depth of section – e.g., chapter = 0, section = 1, etc.

**indent:** Indentation of heading from left margin

**beforeskip:** Absolute value = skip to leave above the heading. If negative, then paragraph indent of text following heading is suppressed.

**afterskip:** if positive, then skip to leave below heading, else negative of skip to leave to right of run-in heading.

**style:** Commands to set style. Since June 1996 release the *last* command in this argument may be a command such as `\MakeUppercase` or `\fbox` that takes an argument. The section heading will be supplied as the argument to this command. So setting #6 to, say, `\bfseries\MakeUppercase` would produce bold, uppercase headings.

If '`*`' is missing, then increment the counter. If it is present, then there should be no `[<altheading>]` argument. The command uses the counter 'secnumdepth'. It contains a pointer to the highest section level that is to be numbered.

**Warning:** The `\@startsection` command should be at the same or higher grouping level as the text that follows it. For example, you should *not* do something like

```
\def\foo{ \begingroup ...
           \paragraph{...}
           \endgroup}
```

Pseudocode for the `\@startsection` command *Historical L<sup>A</sup>T<sub>E</sub>X 2.09 comments* (not necessarily accurate any more):

147 \let\subparagraphmark\@gobble

```

(End of definition for `\sectionmark` and others.)

148 `\message{contents,}`

## 1.3 Table of Contents etc.

### 1.3.1 Convention

`\tf@{foo}` = file number for output for table foo. The file is opened only if `@files` = true.

### 1.3.2 Commands

A `\l@{type}{<entry>}{<page>}` Macro needs to be defined by document style for making an entry of type `<type>` in a table of contents, etc. E.g., the document style should define `\l@chapter`, `\l@section`, etc.

**Note:** When the `\protect` command is used in the `<entry>` or `<text>` of one of the commands below, it causes the following control sequence to be written on the file without being expanded. The sequence will be expanded when the table of contents entry is processed.

**Surprise:** Inside an `\addcontentsline` or `\addtocontents` command argument, the commands: `\index`, `\glossary`, and `\label` are no-ops. This could cause a problem if the user puts an `\index` or `\label` into one of the commands he writes, or into the optional 'short version' argument of a `\section` or `\caption` command.

`\@starttoc` The `\@starttoc{<ext>}` command is used to define the commands: `\tableofcontents`, `\listoffigures`, etc.

For example: `\@starttoc{lof}` is used in `\listoffigures`. This command reads the `.<ext>` file and sets up to write the new `.<ext>` file.

*Historical L<sup>A</sup>T<sub>E</sub>X 2.09 comments (not necessarily accurate any more):*

`\@starttoc{EXT} ==`

```

BEGIN
  \begingroup
    \makeatletter
    read file \jobname.EXT
    IF @filesw = true
      THEN open \jobname.EXT as file \tf@EXT
    FI
    @nobreak :=G FALSE %% added 24 May 89
  \endgroup
END

```

*End of historical L<sup>A</sup>T<sub>E</sub>X 2.09 comments.*

```

149 \def\@starttoc#1{%
150   \begingroup
151     \makeatletter
152     \@input{\jobname.#1}%
153     \if@filesw
154       \expandafter\newwrite\csname tf@#1\endcsname
155       \immediate\openout \csname tf@#1\endcsname \jobname.#1\relax
156     \fi
157     \@nobreakfalse
158   \endgroup}

```

*(End of definition for \@starttoc.)*

**\addcontentsline** The `\addcontentsline{<table>}{<type>}{<entry>}` command allows the user to add his/her own entry to a table of contents, etc. The command adds the entry `\contentsline{<type>}{<entry>}{<page>}{}` to the `.<table>` file.

This macro is implemented as an application of `\addtocontents`. Note that `\thepage` is not expandable during `\protected@write` therefore one gets the page number at the time of the `\shipout`.

```

159 </2ekernel>
160 <*2ekernel | latexrelease>
161 <latexrelease>\IncludeInRelease{2020/10/01}%
162 <latexrelease>          {\addcontentsline}{fourth argument}%
163 \def\addcontentsline#1#2#3{%

```

We add an empty brace pair at the end of `\contentsline` so that the number of argument is identical in documents with and without `hyperref`.

```

164   \addtocontents{#1}{\protect\contentsline{#2}{#3}{\thepage}{}}%
165   \protected@file@percent}%
166 </2ekernel | latexrelease>
167 <latexrelease>\EndIncludeInRelease

178 <latexrelease>\EndIncludeInRelease
179 <*2ekernel>

```

(End of definition for \addcontentsline.)

\@gobble@om Each of these four commands accepts an optional and a mandatory argument, possibly  
\@gobble@som preceded by a star. In all cases the expansion is empty or just manipulates the spaces  
\@gobble@with@sphack@om around the command. Used to disable commands such as \index or \label in certain  
\@gobble@with@sphack@som situations.

```

180 </2ekernel>
181 <*2ekernel | latexrelease>
182 <latexrelease>\IncludeInRelease{2025/06/01}%
183 <latexrelease> \{\@gobble@som\}{Extended index/label}%

```

Just getting rid of the input in an expandable way is done by these two.

```

184 \DeclareExpandableDocumentCommand\@gobble@om{+o+m}{\}
185 \DeclareExpandableDocumentCommand\@gobble@som{s+o+m}{\}

```

When something needs to be suppressed during typesetting, one often also wants to ensure that this doesn't end up with two spaces (in case there is one before and one after). This can't be done expandably.

```

186 \DeclareDocumentCommand\@gobble@with@sphack@om{+o+m}{\@bsphack\@esphack}
187 \DeclareDocumentCommand\@gobble@with@sphack@som{s+o+m}{\@bsphack\@esphack}

```

(End of definition for \@gobble@om and others.)

\addtocontents The \addtocontents{<table>}{<text>} command adds <text> to the .<table> file, with no page number.

```

188 \long\def\addtocontents#1#2{%
189 \protected@write\@auxout
190 \{\let\label\@gobble@om
191 \let\index\@gobble@som
192 \let\glossary\@gobble@om}%
193 \{\string\@writefile{#1}{#2}\}}
194 </2ekernel | latexrelease>
195 <latexrelease>\EndIncludeInRelease
196 <latexrelease>\IncludeInRelease{0000/00/00}%
197 <latexrelease> \{\@gobble@som\}{Extended index/label}%
198 <latexrelease>\long\def\addtocontents#1#2{%
199 <latexrelease> \protected@write\@auxout
200 <latexrelease> \{\let\label\@gobble \let\index\@gobble \let\glossary\@gobble\}%
201 <latexrelease> \{\string\@writefile{#1}{#2}\}}
202 <latexrelease>
203 <latexrelease>\let\@gobble@om\@undefined
204 <latexrelease>\let\@gobble@som\@undefined
205 <latexrelease>\let\@gobble@with@sphack@om\@undefined
206 <latexrelease>\let\@gobble@with@sphack@som\@undefined
207 <latexrelease>\EndIncludeInRelease
208 <*2ekernel>

```

(End of definition for \addtocontents.)

`\contentsline` The `\contentsline{<type>}{<entry>}{<page>}{}` macro produces a `<type>` entry in a table of contents, etc. It will appear in the .toc or other file. For example, the entry for subsection 1.4.3 in the table of contents, might be produced by:

```
\contentsline{subsection}
{\numberline{1.4.3}Gnats and Gnus}{22}{}
```

The `\protect` command causes command sequences to be written without expanding them.

```
209 </2ekernel>
210 <*2ekernel | latexrelease>
211 <latexrelease>\IncludeInRelease{2021/11/15}%
212 <latexrelease>{\contentsline}{Four arguments}%
```

In the toc file `\contentsline` is followed by 4 arguments these days, but only the first 3 are used in the old interface. The fourth was by default empty and only used when `hyperref` was loaded. We now pick up all 4 arguments, save the last one away in `\@contentsline@destination` and then call the old interface. This is done to simplify the interface to `hyperref` and to prepare for future changes.

```
213 \def\contentsline#1#2#3#4{\gdef\@contentsline@destination{#4}%
214 \csname l@#1\endcsname{#2}{#3}}
```

Default definition.

```
215 \let\@contentsline@destination\@empty
216 </2ekernel | latexrelease>
217 <latexrelease>\EndIncludeInRelease
218 <latexrelease>\IncludeInRelease{0000/00/00}%
219 <latexrelease>{\contentsline}{Four arguments}%
220 <latexrelease>
221 <latexrelease>\def\contentsline#1{\csname l@#1\endcsname}
222 <latexrelease>\let\@contentsline@destination\@undefined
223 <latexrelease>\EndIncludeInRelease
224 <*2ekernel>
```

*(End of definition for \contentsline.)*

`\@dottedtocline{<level>}{<indent>}{<numwidth>}{<title>}{<page>}`: Macro to produce a table of contents line with the following parameters:

**level** If `<level>` > `\c@tocdepth`, then no line produced.

**indent** Total indentation from the left margin.

**numwidth** Width of box for number if the `<title>` has a `\numberline` command. As of 25 Jan 1988, this is also the amount of extra indentation added to second and later lines of a multiple line entry.

**title** Contents of entry.

**page** Page number.

Uses the following parameters, which must be set by the document style. They should be defined with `\def`'s.

**pnumwidth** Width of box in which page number is set.

`tocrmarg` Right margin indentation for all but last line of multiple-line entries.

`dotsep` Separation between dots, in mu units. Should be `\def`'d to a number like 2 or 1.7

`\@dottedtocline`

```

225 </2ekernel>
226 <*2ekernel | latexrelease>
227 <latexrelease>\IncludeInRelease{2018/12/01}%
228 <latexrelease>                {\@dottedtocline}{Prevent protrusion}%
229 \def\@dottedtocline#1#2#3#4#5{%
230   \ifnum #1>\c@tocdepth \else
231     \vskip \z@ \@plus.2\p@
232     {\leftskip #2\relax \rightskip \@tocrmarg \parfillskip -\rightskip
233      \parindent #2\relax\@afterindenttrue
234      \interlinepenalty\@M
235      \leavevmode
236      \@tempdima #3\relax

238      \advance\leftskip \@tempdima \null\nobreak\hskip -\leftskip
239      {#4}\nobreak
240      \leaders\hbox{$\m@th
```

If a document uses fonts other than computer modern, the use of a dot from math can be very disturbing despite the fact that this might be the only place in a document that then uses computer modern. Therefore we surround the dot with an `\hbox` to escape to the surrounding text font.

```

240       \mkern \@dotsep mu\hbox{.}\mkern \@dotsep
241       mu$}\hfill
242       \nobreak
243       \hb@xt@\@pnumwidth{\hfil\normalfont \normalcolor #5%
```

We finish off by preventing any protrusion if that is enabled. If protrusion happens the number may shift to the right and as a result you may end up with an additional dot in the toc line in some situations.

```

244               \kern-\p@\kern\p@}%
245       \par}%
246       \fi}
```

*(End of definition for \@dottedtocline.)*

`\noprotrusion` This command, if placed directly to the right (or left) of a word, will prevent protrusion of that word into the margin. It is used in the toc entry lines as they shouldn't protrude. It is implemented as to kerns that cancel each other but being there hide the word so that protrusion is not added. Note that a zero kern or an empty box would not work as the protrusion mechanism will skip over those.

```

247 \DeclareRobustCommand\noprotrusion{\leavevmode\kern-\p@\kern\p@}
```

*(End of definition for \noprotrusion.)*

```

248 </2ekernel | latexrelease>
249 <latexrelease>\EndIncludeInRelease
250 <latexrelease>\IncludeInRelease{0000/00/00}%
251 <latexrelease>                {\@dottedtocline}{Prevent protrusion}%
252 <latexrelease>\def\@dottedtocline#1#2#3#4#5{%
```

```

253 <latexrelease> \ifnum #1>\c@tocdepth \else
254 <latexrelease> \vskip \z@ \@plus.2\p@
255 <latexrelease> {\leftskip #2\relax \rightskip \@tocrmarg \parfillskip -\rightskip
256 <latexrelease> \parindent #2\relax\@afterindenttrue
257 <latexrelease> \interlinepenalty\@M
258 <latexrelease> \leavevmode
259 <latexrelease> \@tempdima #3\relax
260 <latexrelease> \advance\leftskip \@tempdima \null\nobreak\hskip -\leftskip
261 <latexrelease> {#4}\nobreak
262 <latexrelease> \leaders\hbox{$\m@th
263 <latexrelease> \mkern \@dotsep mu\hbox{.}\mkern \@dotsep
264 <latexrelease> mu$}\hfill
265 <latexrelease> \nobreak
266 <latexrelease> \hb@xt@\@pnumwidth{\hfil\normalfont \normalcolor #5}%
267 <latexrelease> \par}%
268 <latexrelease> \fi}
269 <latexrelease>
270 <latexrelease>\let\noprotrusion\@undefined
271 <latexrelease>\EndIncludeInRelease
272 <*2ekernel>

```

**Note:** `\nobreak`'s added 7 Jan 86 to prevent bad line break that left the page number dangling by itself at left edge of a new line.

Changed 25 Jan 88 to use `\leftskip` instead of `\hangindent` so leaders of multiple-line contents entries would line up properly.

`\numberline` `\numberline{<number>}`: For use in a `\contentsline` command. It puts `<number>` flush-left in a box of width `\@tempdima` (Before 25 Jan 88 change, it also added `\@tempdima` to the hanging indentation.)

```

273 \def\numberline#1{\hb@xt@\@tempdima{#1\hfil}}
274 </2ekernel>

```

*(End of definition for \numberline.)*

# File 45

## ltfloat.dtx

### 1 Floats

The different types of floats are identified by a  $\langle type \rangle$  name, which is the name of the counter for that kind of float. For example, figures are of type ‘figure’ and tables are of type ‘table’. Each  $\langle type \rangle$  has associated a positive  $\langle type\ number \rangle$ , which is a power of two. E.g., figures might have type number 1, tables type number 2, programs type number 4, etc.

The locations where a float can go are specified by a  $\langle placement\ specifier \rangle$ , which is a list of the possible locations, each denoted by a letter as follows:

h : here	— at the current location in the text.
t : top	— at the top of a text page.
b : bottom	— at the bottom of a text page.
p : page	— on a separate float page

In addition, in conjunction with these, you can use ‘!’ which means that the current values of the float positioning parameters are ignored for this float. (Has no effect on ‘p’, float page positioning.) For example, ‘pht’ specifies that the float can appear in any of three locations: page, here or top.

#### 1.1 Floating Environments

```
1  $\langle *2kernel \rangle$ 
2  $\backslash message\{floats,\}$ 
```

*Historical L<sup>A</sup>T<sub>E</sub>X 2.09 comments (not necessarily accurate any more):*

Where floats may appear on a page, and how many may appear there are specified by the following float placement parameters. The numbers are named like counters so the user can set them with the ordinary counter-setting commands.

$\backslash c@topnumber$	: Number of floats allowed at the top of a column.
$\backslash topfraction$	: Fraction of column that can be devoted to floats.
$\backslash c@dbltopnumber, \backslash dbltopfraction$	: Same as above, but for double-column floats.
$\backslash c@bottomnumber, \backslash bottomfraction$	: Same as above for bottom of page.
$\backslash c@totalnumber$	: Number of floats allowed in a single column, including in-text floats.
$\backslash textfraction$	: Minimum fraction of column that must contain text.
$\backslash floatpagefraction$	: Minimum fraction of page that must be taken up by float page.
$\backslash dblfloatpagefraction$	: Same as above, for double-column floats.

The document style must define the following.

`\fps@TYPE` : The default placement specifier for floats of type TYPE.

`\ftype@TYPE` : The type number for floats of type TYPE.

`\ext@TYPE` : The file extension indicating the file on which the contents list for float type TYPE is stored.  
For example, `\ext@figure = 'lof'`.

`\fnum@TYPE` : A macro to generate the figure number for a caption.  
For example, `\fnum@TYPE == Figure \thefigure`.

`\@makecaption{NUM}{TEXT}` :  
A macro to make a caption, with NUM the value produced by `\fnum@...` and TEXT the text of the caption.  
It can assume it's in a `\parbox` of the appropriate width.

`\@float{TYPE}[PLACEMENT]` : This macro begins a float environment for a single-column float of type TYPE with PLACEMENT as the placement specifier. The default value of PLACEMENT is defined by `\fps@TYPE`. The environment is ended by `\end@float`.  
E.g., `\figure == \@float{figure}, \endfigure == \end@float`.

```
\@float{TYPE}[PLACEMENT] ==
BEGIN
  if hmode then \@bsphack
    \@floatpenalty := -10002
  else \@floatpenalty := -10003
  fi
  \@captype ==L TYPE
  \@dblflset
  \@fps ==L PLACEMENT
  \@onelevel@sanitize \@fps
  add default PLACEMENT if at most ! in PLACEMENT ==
\@fpsadddefault
  if inner
    then LaTeX Error: 'Not in outer paragraph mode.'
    \@floatpenalty := 0
  else if \@freelist nonempty
    then \@currbox :=L head of \@freelist
    \@freelist :=G tail of \@freelist
    \count\@currbox :=G 32*\ftype@TYPE +
                                bits determined by PLACEMENT
    else \@floatpenalty := 0
    LaTeX Error: 'Too many unprocessed floats'
  fi
  fi
  \@currbox :=G \color@vbox
```

```

\normalcolor
\ vbox{
  %% 15 Dec 87 -
  %% removed \boxmaxdepth :=L 0pt
  %% that made box 0 depth because it screwed
  %% things up. Instead, added \vskip0pt at end
  \hsize = \columnwidth
  \@parboxrestore
  \@floatboxreset
END

```

```

\caption ==
BEGIN
  \refstepcounter{\@capttype}
  \@dblarg{\@caption{\@capttype}}
END

```

In following definition, `\par` moved from after `\addcontentsline` to before `\addcontentsline` because the `\write` could cause an extra blank line to be added to the paragraph above the caption. (Change made 12 Jun 87)

```

\@caption{TYPE}[STEXT]{TEXT} ==
BEGIN
  \par
  \addcontentsline{\ext@TYPE}{TYPE}{\numberline{\theTYPE}{STEXT}}
  \begingroup
    \@parboxrestore
    \@normalsize
    \makecaption{\fnum@TYPE}{TEXT}
  \par
  \endgroup
END

```

`\@dblfloat{TYPE}[PLACEMENT]` : Macro to begin a float environment for a double-column float of type TYPE with PLACEMENT as the placement specifier. The default value of PLACEMENT is 'tp'

The environment is ended by `\end@dblfloat`.

E.g., `\figure* == \@dblfloat{figure}`,

`\endfigure* == \end@dblfloat`.

```

\@dblfloat{TYPE}[PLACEMENT] ==
  Identical to \@float{TYPE}[PLACEMENT] except \hsize and \linewidth
  are set to \textwidth.

```

*End of historical L<sup>A</sup>T<sub>E</sub>X 2.09 comments.*

`\@floatpenalty`

```

3 \newcount\@floatpenalty

```

*(End of definition for \@floatpenalty.)*

`\caption` This is set to be an error message outside a float since no `captype` is defined there; this may need to be changed by some classes.

```

4 \def\caption{%
5   \ifx\@captype\@undefined
6     \latexerror{\noexpand\caption outside float}\@ehd
7     \expandafter\@gobble
8   \else
9     \refstepcounter\@captype
10    \expandafter\@firstofone
11  \fi
12  {\@dblarg{\@caption\@captype}}%
13 }

```

*(End of definition for \caption.)*

`\@caption`

```

14 \long\def\@caption#1[#2]#3{%
15   \par
16   \addcontentsline{\csname ext@#1\endcsname}{#1}%
17   {\protect\numberline{\csname the#1\endcsname}{\ignorespaces #2}}%
18   \begingroup

```

The paragraph setting parameters are normalised at this point, however `\@parboxrestore` resets `\everypar` which is not correct in this context so `\@setminipage` is called if needed.

The float mechanism, like `minipage`, sets the flag `@minipage` true before executing the user-supplied text. Many L<sup>A</sup>T<sub>E</sub>X constructs test for this flag and do not add vertical space when it is true. The intention is that this emulates T<sub>E</sub>X's ‘top of page’ behaviour. The flag must be set false at the start of the first paragraph. This is achieved by a redefinition of `\everypar`, but the call to `\@parboxrestore` removes that redefinition, so it is re-inserted if needed. If the flag is already false then the `\caption` was not the first entry in the float, and so some other paragraph has already activated the special `\everypar`. In this case no further action is needed.

```

19   \@parboxrestore
20   \if@minipage
21     \@setminipage
22   \fi
23   \normalsize
24   \@makecaption{\csname fnum@#1\endcsname}{\ignorespaces #3}\par
25   \endgroup}

```

*(End of definition for \@caption.)*

`\@float`  
`\@dblflset`

```

26 \def\@float#1{%
27   \ifnextchar[%
28     {\@xfloat{#1}}%
29     {\edef\reserved@a{\noexpand\@xfloat{#1}[\csname fps@#1\endcsname]}}%
30     \reserved@a}

```

*(End of definition for \@float and \@dblflset.)*

`\@dblfloat`

```

31 \def\@dblfloat{%
32   \if@twocolumn\let\reserved@a\@dblft\else\let\reserved@a\@float\fi
33   \reserved@a}

```

(End of definition for \@dblfloat.)

`\fps@dbl` Note that all double floats have default fps ‘tp’.

(End of definition for \fps@dbl.)

`\@setfps` This sets the fps, dealing with error conditions by adding the default.

(End of definition for \@setfps.)

`\@xfloat` The first part of this sets the count register that stores all the information about the type and fps of the float.

We assume here that the default specifiers already contain no active characters.

It may be better to store the defaults as numbers, rather than symbol strings.

The remainder sets up the box in which the float is typeset, and the typesetting environment to be used. It is essential to have the extra box to avoid the unwanted space that would otherwise often be put at the top of the float.

It ends with a hook; not sure how useful this is but it is needed at present to deal with double-column floats.

**\@floatboxreset** The rationale for allowing these normally global flags to be set locally here, via **\@parboxrestore**, was stated originally by Donald Arseneau and extended by Chris Rowley. It is because these flags are only set globally to true by section commands, and these should never appear within marginals or floats or, indeed, in any group; and they are only ever set globally to false when they are definitely true.

If anyone is unhappy with this argument then both flags should be treated as in **\@setnobreak**; otherwise this command will be redundant.

```

Historical *LaTeX* 2.09 comments (not necessarily accurate any more):

MARGINAL NOTES:

Marginal notes use the same mechanism as floats to communicate with the `\output` routine. Marginal notes are distinguished from floats by having a negative placement specification. The command `\marginpar [LTEXT]{RTEXT}` generates a marginal note in a parbox, using LTEXT if it's on the left and RTEXT if it's on the right. (Default is RTEXT = LTEXT.) It uses the following parameters.

`\marginparwidth` : Width of marginal notes.  
`\marginparsep` : Distance between marginal note and text.  
the page layout to determine how to move the marginal  
note into the margin. E.g., `\@leftmargin skip ==`  
`\hskip -\marginparwidth \hskip -\marginparsep` .  
`\marginparpush` : Minimum vertical separation between `\marginpar`'s

Marginal notes are normally put on the outside of the page if `@mparswitch = true`, and on the right if `@mparswitch = false`. The command `\reversemarginpar` reverses the side where they are put. `\normalmarginpar` undoes `\reversemarginpar`. These commands have no effect for two-column output.

SURPRISE: if two marginal notes appear on the same line of text, then the second one could appear on the next page, in a funny position.

```

355 <latexrelease>\long\def \@savemarbox #1#2{%
356 <latexrelease> \global\setbox #1%
357 <latexrelease> \color@vbox
358 <latexrelease> \vtop{%
359 <latexrelease> \hsize\marginparwidth
360 <latexrelease> \@parboxrestore
361 <latexrelease> \@marginparreset
362 <latexrelease> #2%
363 <latexrelease> \@minipagefalse
364 <latexrelease> \outer@nobreak
365 <latexrelease> }%
366 <latexrelease> \color@endbox
367 <latexrelease>}
368 <latexrelease>\EndIncludeInRelease
369 <*2ekernel>

```

*(End of definition for \@savemarbox.)*

`\@marginparreset` The rationale for allowing these normally global flags to be set locally here, via `\@parboxrestore` was stated originally by Donald Arseneau and extended by Chris Rowley. It is because these flags are only set globally to true by section commands, and these should never appear within marginals or floats or, indeed, in any group; and they are only ever set globally to false when they are definitely true.

If anyone is unhappy with this argument then both flags should be treated as in `\@setnobreak`; otherwise this command will be redundant.

```

370 \def \@marginparreset {%
371   \reset@font
372   \normalsize
373 %   \let@if@nobreak\iffalse
374 %   \let@if@noskipsec\iffalse

```

```

375 %          \@setnobreak
376          \@setminipage
377 }

```

(End of definition for \@marginparreset.)

\@xympar

Setting the box here is done only because the code uses \end@float; it will be empty and gets discarded.

```

378 \def \@xympar{%
379   \ifnum \@floatpenalty < \z@ \@cons \@currlist \@marbox \fi
380   \setbox \@tempboxa
381     \color@vbox
382     \vbox \bgroup
383   \end@float
384   \@ignorefalse
385   \@esphack
386 }

```

(End of definition for \@xympar.)

\reversemarginpar

\normalmarginpar

```

387 \def \reversemarginpar {\global \@parbottom \z@ \@reversemargintrue}
388 \def \normalmarginpar {\global \@parbottom \z@ \@reversemarginfalse}

```

(End of definition for \reversemarginpar and \normalmarginpar.)

```

389 \message{footnotes,}

```

## 1.2 Footnotes

Historical  $\text{\LaTeX}$  2.09 comments (not necessarily accurate any more):

\footnote{NOTE} : User command to insert a footnote.

\footnote[*NUM*]{NOTE}: User command to insert a footnote numbered *NUM*, where *NUM* is a number – 1, 2, etc. For example, if footnotes are numbered \*, \*\*, etc. within pages, then \footnote[2]{...} produces footnote '\*\*'. This command does not step the footnote counter.

\footnotemark[*NUM*] : Command to produce just the footnote mark in the text, but no footnote. With no argument, it steps the footnote counter before generating the mark.

\footnotetext[*NUM*]{TEXT} : Command to produce the footnote but no mark. \footnote is equivalent to \footnotemark \footnotetext .

As in PLAIN, footnotes use \insert\footins, and the following parameters:

`\footnotesize` : Size-changing command for footnotes.

`\footnotesep` : The height of a strut placed at the beginning of every footnote.

`\skip\footins` : Space between main text and footnotes. The rule separating footnotes from text occurs in this space. This space lies above the strut of height `\footnotesep` which is at the beginning of the first footnote.

`\footnoterule` : Macro to draw the rule separating footnotes from text. It is executed right after a `\vspace` of `\skip\footins`. It should take zero vertical space—i.e., it should to a negative skip to compensate for any positive space it occupies. (See PLAIN.TEX.)

`\interfootnotelinepenalty` : Interline penalty for footnotes.

`\thefootnote` : In usual LaTeX style, produces the footnote number. If footnotes are to be numbered within pages, then the document style file must include an `\@addtoreset` command to cause the footnote counter to be reset when the page counter is stepped. This is not a good idea, though, because the counter will not always be reset in time to ensure that the first footnote on a page is footnote number one.

`\@thefnmark` : Holds the current footnote’s mark—e.g., `\dag` or `'1'` or `'a'`.

`\@mpfnnumber` : A macro that generates the numbers for `\footnote` and `\footnotemark` commands. It == `\thefootnote` outside a minipage environment, but can be changed inside to generate numbers for `\footnote`’s.

`\@makefnmark` : A macro to generate the footnote marker from `\@thefnmark`. The default definition was `\hbox{$\@thefnmark$}`.

This is now replaced by  
`\textsuperscript{\@thefnmark}`

`\@makefntext{NOTE}` :  
 Must produce the actual footnote, using `\@thefnmark` as the mark of the footnote and NOTE as the text. It is called when effectively inside a `\parbox`, with `\hsize = \columnwidth`.  
 For example, it might be as simple as  
`$\@thefnmark$ NOTE`

In a minipage environment, `\footnote` and `\footnotetext` are redefined so that

- (a) they use the counter `mpfootnote`
- (b) the footnotes they produce go at the bottom of the minipage.

The switch is accomplished by letting `\@mpfn == footnote` or `mpfootnote` and `\thempfn == \thefootnote` or `\thempfootnote`, and by redefining `\@footnotetext` to be `\@mpfootnotetext` in the minipage.

```

\footnote{NOTE} ==

## File 47

# ltbibl.dtx

## 1 Bibliography Generation

A bibliography is created by the `thebibliography` environment, which generates a title such as “References”, and a list of entries. The `BIBTEX` program will create a file containing such an environment, which will be read in by the `\bibliography` command. With `BIBTEX`, the following commands will be used.

`\bibliography`      `\bibliography{<file1,file2, ...,filen>}` : specifies the bibdata files. Writes a `\bibdata` entry on the `.aux` file and tries to read in `mainfile.bbl`.

`\bibliographystyle`      `\bibliographystyle{<style>}` : Writes a `\bibstyle` entry on the `.aux` file.

`thebibliography (env.)`      The `thebibliography` environment is a list environment. To save the use of an extra counter, it should use `enumiv` as the item counter. Instead of using `\item`, items in the bibliography are produced by the following commands:

`\bibitem{<name>}` : Produces a numbered entry cited as `<name>`.

`\bibitem[<label>]{<name>}` : Produces an entry labeled by `<Label>` and cited by `<name>`.

    The former is used for bibliographies with citations like [1], [2], etc.; the latter is used for citations like [Knuth82].

    The document class must define the `thebibliography` environment. This environment has a single argument, which is the widest bibliography label— e.g., if the [Knuth67] is the widest entry, then this argument will be Knuth67. The `\thebibliography` command must begin a list environment, which the `\endthebibliography` command ends.

`\cite`      Entries are cited by the command `\cite{<name>}`.

`\nocite`      `\nocite{<citations>}` puts information on the `.aux` file that causes `BIBTEX` to include the `{<citations>}` list in the bibliography, but puts nothing in the text.

`\nocite{*}` is special: it tells `BIBTEX` to put the whole of a collection of references into the bibliography.

```
1 <*2ekernel>
2 \message{bibliography,}
```

*Historical  $\LaTeX$  2.09 comments (not necessarily accurate any more):*

### PARAMETERS

`@cite` : A macro such that `\@cite{LABEL1,LABEL2}{NOTE}` produces the output for a `\cite[NOTE]{FOO1,FOO2}` command, where entry `FOOi` is defined by `\bibitem[LABELi]{FOOi}`. The switch `@tempswa` is true if the optional `NOTE` argument is present. The default definition is :

```
\@cite{LABELS}{NOTE} ==
  BEGIN [LABELS
    IF @tempswa = T THEN , NOTE FI
  ]
END
```

`@biblabel` : A macro to produce the label in the bibliography entry. For `\bibitem[LABEL]{NAME}`, the label is

generated by `\@biblabel{LABEL}`. It has the default definition `\@biblabel{LABEL} -> [LABEL]`.

#### CONVENTION

`\b@F00` : The name or number of the reference created by `\cite{FOO}`  
 E.g., if `\cite{FOO} -> [17]` , then `\b@F00 -> 17`.

*End of historical L<sup>A</sup>T<sub>E</sub>X 2.09 comments.*

38     \edef\@citeb{\expandafter\@firstofone\@citeb\@empty}}%
39   \if@filesw\immediate\write\@auxout{\string\citation{\@citeb}}\fi

```

Using \hbox instead of \mbox is fine because of the \leavevmode above. In fact the use of a box around the citation contents is more than questionable in my view (FMi), but within 2e I have to keep that for compatibility reasons as it would probably change too many existing documents. Its main reason is to avoid hyphenation of labels such as [FOOB89] into [FOO- B89] so in certain styles it makes sense; but, for example, in author year citations it becomes more than questionable.

So Chris added yet another hook here, as suggested by, at least, Donald Arseneau. Note that this one is inside the first argument of the \@cite hook. This decouples the top-level typesetting of the citation from the details of the other business conducted here. All this really needs a complete rethink to get the right modularity.

```

40   \ifundefined{b@\@citeb}{\hbox{\reset@font\bfseries ?}}%
41   \G@refundefinedtrue

```

(End of definition for \bibliographystyle.)

\nocite (Added 14 Jun 85)

This puts information on the .aux file that causes BibTeX to include the citation list in the bibliography, but puts nothing in the text.

RmS 93/08/06: Made loop for \nocite like that for \citex, to get rid of leading spaces.

```
59 \</2ekernel>
60 \<*2ekernel | latexrelease>
61 \<latexrelease>\IncludeInRelease{2021/06/01}%
62 \<latexrelease>          {\nocite}{Allow nocite in preamble}%
63 \def\nocite#1{\@bsphack
```

With the implementation designed already in L<sup>A</sup>T<sub>E</sub>X 2.09 the \nocite command will not work before \begin{document} since it tries to write to the .aux file which is not open before that point. As a result the “reference” will appear on the terminal and nothing else will happen.

[This would be easy to fix, but then a document using the fix will silently fail on an older release of L<sup>A</sup>T<sub>E</sub>X, missing all citations done with \nocite. Thus we do only generate an error message and leave the fix for a L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub> successor.]

Given that we are now a quarter century into using L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub> there is no good reason any more do limit ourself to 2.09 considerations. So we now simply delay the \nocite if it is issued in the preamble.

```
64   \ifx\@onlypreamble\document
```

Since we are after \begin{document} we can do the citations:

```
65   \@for\@citeb:=#1\do{%
66     \edef\@citeb{\expandafter\@firstofone\@citeb}%
67     \if@filesw\immediate\write\@auxout{\string\citation{\@citeb}}\fi
68     \@ifundefined{b@\@citeb}{\G@refundefinedtrue
69       \@latex@warning{Citation ‘\@citeb’ undefined}}{}%
70   \else
```

But before \begin{document} we raised an error message in the past but as of 2021/05 not any longer.

```
71 %   \@latex@error{Cannot be used in preamble}\@eha
```

Instead we delay the declaration to the start of the document. We have to use a late hook for this, so that it comes after the .aux file is open for writing and after \@preamblecmds was executed to change the above test. Therefore \AtBeginDocument would still be too early.

```
72   \AddToHook{begindocument/end}[kernel]{\nocite{#1}}%
73   \fi
```

```

74 \esphack}
75 </2ekernel | latexrelease>
76 <latexrelease>\EndIncludeInRelease

77 <latexrelease>\IncludeInRelease{0000/00/00}%
78 <latexrelease> \nocite}{Allow nocite in preamble}%
79 <latexrelease>
80 <latexrelease>\def\nocite#1{\@bsphack
81 <latexrelease> \ifx\@onlypreamble\document
82 <latexrelease> \@for\citeb:=#1\do{%
83 <latexrelease> \edef\citeb{\expandafter\@firstofone\citeb}%
84 <latexrelease> \if@filesw\immediate\write\@auxout{\string\citation{\citeb}}\fi

*(End of definition for \@biblabel.)*

## File 48

# ltmarks.dtx

### Abstract

Marks are used to communicate information about the content of a page to the output routine. For example, in order to construct running headers, the output routine needs information about which section names are present on a page, and this information is passed to it through the mark system. However, marks may also be used for other purposes. This module provides a generalized mechanism for marks of independent classes.

## 1 Introduction

The  $\text{T}_{\text{E}}\text{X}$  engines offer a low-level mark mechanism to communicate information about the content of the current page to the asynchronous operating output routine. It works by placing `\mark` commands into the source document. When the material for the current page is assembled in box 255,  $\text{T}_{\text{E}}\text{X}$  scans for such marks and sets the commands `\topmark`, `\firstmark` and `\botmark`. The `\firstmark` receives the content of the first `\mark` seen in box 255 and `\botmark` the content of the last mark seen. The `\topmark` holds the content of the last mark seen on the previous page or more exactly the value of `\botmark` from the previous page. If there are no marks on the current page then all three are made equal to the `\botmark` from the previous page.

This mechanism works well for simple formats (such as plain  $\text{T}_{\text{E}}\text{X}$ ) whose output routines are only called to generate pages. It fails, however, in  $\text{L}^{\text{A}}\text{T}_{\text{E}}\text{X}$  (and other more complex formats), because here the output routine is sometimes called without producing a page, e.g., when encountering a float and placing it into one of the float regions. In that case the output routine is called, determines where to place the float, alters the goal for assembling text material (if the float was added to the top or bottom region) and then it resumes collecting textual material.

As a result the `\botmark` gets updated and so `\topmark` no longer reflects the situation at the top of the next page when that page is finally boxed.

Another problem for  $\text{L}^{\text{A}}\text{T}_{\text{E}}\text{X}$  was that it wanted to use several “independent” marks and in the early implementations of  $\text{T}_{\text{E}}\text{X}$  there was only a single `\mark` command available. For that reason  $\text{L}^{\text{A}}\text{T}_{\text{E}}\text{X}$  implemented its own mark mechanism where the marks always contained two parts with their own interfaces: `\markboth` and `\markright` to set marks and `\leftmark` and `\rightmark` to retrieve them.

However, this extended mechanism (while supporting scenarios such as chapter/section marks) was far from general. The mark situation at the top of a page (i.e., `\topmark`) remained unusable and the two marks offered were not really independent of each other because `\markboth` (as the name indicates) was always setting both.

The new mechanism overcomes both issues:

- It provides arbitrarily many, fully independent named marks, that can be allocated and, from that point onwards, used.
- It offers access for each such marks to retrieve its top, first, and bottom values separately.
- Furthermore, the mechanism is augmented to give access to marks in different “regions” which may not be just full pages.

## 2 Design-level and code-level interfaces

The interfaces are mainly meant for package developers, but they are usable (with appropriate care) also in the document preamble, for example, when setting up special running headers with `fancyhdr`, etc. They are therefore available both as CamelCase commands as well as commands for use in the L3 programming layer. Both are described together below.

---

<code>\NewMarkClass</code>	<code>\NewMarkClass {&lt;class&gt;}</code>
<code>\mark_new_class:n</code>	<code>\mark_new_class:n {&lt;class&gt;}</code>

---

Declares a new `<class>` of marks to be tracked by L<sup>A</sup>T<sub>E</sub>X. Each `<class>` must be declared before it is used.

Mark classes can only be declared before `\begin{document}`.

---

<code>\InsertMark</code>	<code>\InsertMark {&lt;class&gt;} {&lt;text&gt;}</code>
<code>\mark_insert:nn</code>	<code>\mark_insert:nn {&lt;class&gt;} {&lt;text&gt;}</code>

---

Adds a mark to the current galley for the `<class>`, containing the `<text>`.

It has no effect in places in which you can't place floats, e.g., a mark inside a box or inside a footnote never shows up anywhere.

If used in vertical mode it obeys L<sup>A</sup>T<sub>E</sub>X's internal `@nobreak` switch, i.e., it does not introduce a breakpoint if used after a heading. If used in horizontal mode it doesn't handle spacing (like, for example, `\index` or `\label` does, so it should be attached to material that is typeset.

---

<code>insertmark</code>	<code>\AddToHook {insertmark} {&lt;code&gt;}</code>
-------------------------	---

---

When marks are inserted, the mark content may need some special treatment, e.g., by default `\label`, `\index`, and `\glossary` do not expand at this time (but only later if and when the mark content is actually used. In order to allow packages to augment or alter this setup there is a public hook `insertmark` that is executed at this point. It runs in a group so local modification to commands are only applied to the `<text>` argument of `\InsertMark` or `\mark_insert:nn`.

---

<code>\TopMark</code>	<code>* \TopMark</code>	<code>[\langle region \rangle] {\langle class \rangle}</code>
<code>\FirstMark</code>	<code>* \FirstMark</code>	<code>[\langle region \rangle] {\langle class \rangle}</code>
<code>\LastMark</code>	<code>* \LastMark</code>	<code>[\langle region \rangle] {\langle class \rangle}</code>
<code>\mark_use_top:nn</code>	<code>* \mark_use_top:nn</code>	<code>{\langle region \rangle} {\langle class \rangle}</code>
<code>\mark_use_first:nn</code>	<code>* \mark_use_first:nn</code>	<code>{\langle region \rangle} {\langle class \rangle}</code>
<code>\mark_use_last:nn</code>	<code>* \mark_use_last:nn</code>	<code>{\langle region \rangle} {\langle class \rangle}</code>

---

These functions expand to the appropriate mark  $\langle text \rangle$  for the given  $\langle class \rangle$  in the specified  $\langle region \rangle$ . The default  $\langle region \rangle$  in the design-level commands is `page`. Note that with the L3 layer commands there are no optional arguments, i.e., both arguments have to be provided.

**TeXhackers note:** The result is returned within the `\unexpanded` primitive (`\exp_not:n`), which means that the  $\langle text \rangle$  does not expand further when appearing in an `x`-type or `e`-type argument expansion.

The “first” and “last” marks are those seen first and last in the current region/page, respectively. The “top” mark is the last mark of the  $\langle class \rangle$  seen in an earlier region, i.e., the  $\langle text \rangle$  what would be “current” at the very top of the region.

### Important!

The commands are only meaningful inside the output routine, in other places their result is (while not random) unpredictable due to the way L<sup>A</sup>T<sub>E</sub>X cuts text material into pages. There is, however, one exception: if you produce multiple columns using the `multicol` package, it is possible to retrieve mark values from the regions `first-column`, `last-column`, `mcol-1`, `mcol-2`,... directly after the environment has ended. This can, for example, be useful if a `multicols` has been used inside a box.

Currently,  $\langle region \rangle$  is one of `page`, `previous-page`, `column`, `previous-column`, `first-column`, `last-column`, and `mcol-1` (first column in a `multicols`), `mcol-2` (second column in a `multicols`), up to `mcol-20` (twentieth column in a `multicols`). See section 2.2 for discussion of how these regions behave and how one can make use of them.

---

<code>\IfMarksEqualTF</code>	<code>* \IfMarksEqualTF</code>	<code>[\langle region \rangle] {\langle class \rangle} {\langle pos_1 \rangle} {\langle pos_2 \rangle} {\langle true \rangle} {\langle false \rangle}</code>
<code>\IfMarksEqualT</code>	<code>* \mark_if_eq:nnnnTF</code>	<code>{\langle region \rangle} {\langle class \rangle} {\langle pos_1 \rangle} {\langle pos_2 \rangle} {\langle true \rangle} {\langle false \rangle}</code>
<code>\IfMarksEqualF</code>	<code>* \mark_if_eq:nnnnnnTF</code>	<code>{\langle region_1 \rangle} {\langle class_1 \rangle} {\langle pos_1 \rangle}</code>
<code>\mark_if_eq:nnnnTF</code>	<code>*</code>	<code>{\langle region_2 \rangle} {\langle class_2 \rangle} {\langle pos_2 \rangle} {\langle true \rangle} {\langle false \rangle}</code>
<code>\mark_if_eq:nnnnnnTF</code>	<code>*</code>	

---

These conditionals allow you to compare the content of two marks and act based on the result. The commands work in an expansion context, if necessary.

It is quite common when programming with marks to need to interrogate conditions such as whether marks have appeared on a previous page, or if there are multiple marks present on the current page, and so on. The tests above allow for the construction of a variety of typical test scenarios, with three examples presented below.

The first two conditionals cover only the common scenarios. Both marks are picked up from the same  $\langle region \rangle$  (by default `page`) and they have to be of the same  $\langle class \rangle$ .<sup>41</sup> The  $\langle pos_i \rangle$  argument can be either `top`, `first`, or `last`.

Important to note is that the comparison is not with respect to the textual content of the marks but whether or not they originated from the same `\InsertMark` command (or the L3 layer version `\mark_insert:nn`).

If you wish to compare marks across different regions or across different classes, you have to do it using the generic test only available in the L3 programming layer or do it manually, i.e., get the marks and then compare the values yourself.<sup>42</sup>

<sup>41</sup>If an undeclared mark class is used the tests return `true` (not an error).

<sup>42</sup>If two undeclared mark classes are compared the result is always `true`; if a declared and an undeclared

## 2.1 Use cases for conditionals

However, the basic version is enough for the following typical use cases:

**Test for at most one mark of class `myclass` on current page:** If the first and last mark in a region are the same then either there was no mark at all, or there was at most one. To test this on the current page:

```
\NewMarkClass{myclass}
\IfMarksEqualTF{myclass}{first}{last}
{ <zero or one mark> }{ <two or more marks> }
```

**Test for no mark of class `myclass` in the previous page:** If the top mark is the same as the first mark, there is no mark in the region at all. If we wanted to do this test for the previous page:

```
\IfMarksEqualTF[previous-page]{myclass}{top}{first}
{ <no marks> }{ <at least one mark> }
```

Comparing top and last would give you the same result.

**Test for zero, one, or more than one:** Combining the two tests from above you can test for zero, one or more than one mark.

```
\IfMarksEqualTF{myclass}{top}{first}
{ <no marks> }
{\IfMarksEqualTF{myclass}{first}{last}
{ <exactly one mark> }{ <more than one mark> }}
```

If you need one of such tests more often (or if you want a separate command for it for readability), then consider defining:

```
\providecommand\IfNoMarkTF[2][page]{\IfMarksEqualTF[#1]{#2}{first}{last}}
```

## 2.2 Understanding regions

If a page has just been finished then the region `page` refers to the current page and `previous-page`, as the name indicates, refers to the page before the current page. This means you are able to access mark information for the current page as well as for the page before (as long as you are inside the output routine) without the need to explicitly save that information beforehand. The `page` region is the region that is most often queried, which is why commands like `\FirstMark` use that region by default.

In single column documents the `column` is the same as the `page` region, but in two-column documents (if not produced by `multicols`), `column` refers to the current column that just got finished and `previous-column` to the one previously finished. Code for running headers is (in standard L<sup>A</sup>T<sub>E</sub>X) evaluated only after both columns have been assembled, which is another way of saying that in that case `previous-column` refers to the left column and `column` to the right column. However, to make these somewhat easier to use, there are also aliased names for these two regions: `first-column` and `last-column`.<sup>43</sup>

---

mark class is used it is always *false*.

<sup>43</sup>The region is called “last-column” not “second-column” in anticipation of extending the mechanism to multiple columns, where first and last would still make sense. There aren’t any `previous-first-column` and `previous-last-column` regions to access the corresponding columns from the previous page.

Note that you can only look backwards at already processed regions, e.g., in a `twoside` document finishing a recto (odd, right-hand) page you can access the data from the facing verso (left-hand) page, but if you are finishing a left-hand page you can't integrate data from the upcoming right-hand page. If such a scenario needs to be realized then it is necessary to save the left-hand page temporarily instead of finalizing it, process material for the right-hand page and once both are ready, attach running headers and footers and shipout out both in one go.<sup>44</sup>

The situation starts getting rather complex if you allow for multiple columns in the way they are supported by the `multicol` package. In this case you might have a variable number of “columns” on a single page to be shipped out. And even if not, then a `multicols` might start or end in the middle of the page; in either case, the regions `column` and `previous-column` become rather meaningless and you should therefore not use them.<sup>45</sup> Instead, the algorithm offers `mcol-1`, `mcol-2`, `mcol-3`, etc., to represent the columns in the `multicols` on the current page to be shipped out. If there is more than one `multicols` on the current page then in the output routine only the columns of the last one will be accessible.

These provisions cover, out of the box, a number of layouts and use cases, but obviously not all. However, more cases can be supported by storing away mark information during the processing. Here is the full algorithm:

- The `column` region is used by the “current column” that is being built (moving through all columns with `previous-column` trailing behind (to handle top marks properly).
- When the `multicols` starts, the `column` region is cleared, i.e., from that point on it looks as if there have not been any marks so far. This will make sure that the top mark in the first column is always empty.
- If the `multicols` extends beyond the current page, then the material designated for the current page is split into columns. The `column` region is used to represent each column in turn.
  - First we copy the current data from `column` to `previous-column`. Then the mark data from the current column is placed into the `column` region. Then we alias `column` to `mcol-1`.
  - These steps are repeated for all columns of the `multicols` environment.
  - Finally, the first and the last column of that page is also made available as `first-column` and `last-column`, respectively.
- All those marks inside any of the columns are also available in the `page` region. Thus, if you are interested in the top, first, or last mark of a specific class on the whole page you simply need to query for it in the `page` region.
- If the `multicols` continues across several pages then this algorithm above is repeated for each page, except that the `column` region is not cleared again. This means that the top mark of the first column of the next page will be the last mark of the last column from the previous page.

---

<sup>44</sup>As of now that scenario is not (yet) officially supported but it would be possible to achieve this using the shipout hooks to store the verso page and then on the next shipout use the hook to shipout both with running headers and footers attached.

<sup>45</sup>They return something, because they represent the last two columns of the `multicols` when you are inside the output routine, but that is obviously of little use.

- When the `multicols` finishes the remaining material for the current page is balanced to produce columns of roughly equal height.
- Again `column` and `previous-column` are used while this balancing happens and `mcol-1`, `mcol-2`, etc., are used to represent the column regions and `first-column` and `last-column` are set appropriately.
- Then the balanced set of columns is returned back to the page (since there may be space for further material). In addition, all marks inside that material are reinserted so that they become available in the `page` region.
- As a side effect, it is possible (and useful in certain circumstances) to query for mark classes directly after the `multicols` has ended without the need to be inside the output routine. The regions that can be queried this way are `mcol-1`, `mcol-2`, etc. (up to the number of columns the multicol had) and `first-column` and `last-column`.

## 2.3 Debugging mark code

---

<code>\DebugMarksOn</code>	<code>\DebugMarksOn ... \DebugMarksOff</code>
<code>\DebugMarksOff</code>	
<code>\mark_debug_on:</code>	Commands to turn the debugging of mark code on or off. The debugging output is
<code>\mark_debug_off:</code>	rather coarse and not really intended for normal use at this point in time.

---

## 3 Application examples

If you want to figure out if a break was taken at a specific point, e.g., whether a heading appears at the top of the page, you can do something like this:

```
\newcounter{breakcounter}
\NewMarkClass{break}
\newcommand\markedbreak[1]{\stepcounter{breakcounter}%
                           \InsertMark{break}{\arabic{breakcounter}}%
                           \penalty #1\relax
                           \InsertMark{break}{-\arabic{breakcounter}}}
```

To test if the break was taken you can test if `\TopMark{break}` is positive (taken) or negative (not taken) or zero (there was never any marked break so far). The absolute value can be used to keep track of which break it was (with some further coding).

*to be extended with additional application examples*

## 4 Legacy L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub> interface

Here we describe the interfaces that L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub> offered since the early nineties and some minor extensions.

## 4.1 Legacy design-level and document-level interfaces

---

<code>\markboth</code>	<code>\markboth {&lt;left&gt;} {&lt;right&gt;}</code>
<code>\markright</code>	<code>\markright {&lt;right&gt;}</code>

---

L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub> uses two marks which aren't fully independent. A “left” mark generated by the first argument of `\markboth` and a “right” mark generated by the second argument of `\markboth` or by the only argument of `\markright`. The command `\markboth` and `\markright` are in turn called from heading commands such as `\chaptermark` or `\sectionmark` and their behavior is controlled by the document class.

For example, in the `article` class with `twoside` in force the `\sectionmark` will issue `\markboth` with an empty second argument and `\subsectionmark` will issue `\markright`. As a result the left mark will contain chapter titles and the right mark subsection titles.

Note, however, that in one-sided documents the standard behavior is that only `\markright` is used, i.e., there will only be right-marks but no left marks!

---

<code>\leftmark</code>	<code>* \leftmark</code>
<code>\rightmark</code>	<code>* \rightmark</code>

---

These functions return the appropriate mark value from the current page and work as before, that is `\leftmark` will get the last (!) left mark from the page and `\rightmark` the first (!) right mark.

In other words they work reasonably well if you want to show the section title that is current when you are about to turn the page and also show the first subsection title on the current page (or the last from the previous page if there wasn't one). Other combinations can't be shown using this interface.

The commands are fully expandable, because this is how they have been always defined in L<sup>A</sup>T<sub>E</sub>X. However, this is of course only true if the content of the mark they return is itself expandable and does not contain any fragile material. Given that this can't be guaranteed for arbitrary content, a programmer using them in this way should use `\protected@edef` and *not* `\edef` to avoid bad surprises as far as this is possible, or use the new interfaces (`\TopMark`, `\FirstMark`, and `\LastMark`) which return the `<text>` in `\exp_not:n` to prevent uncontrolled expansion.

## 4.2 Legacy interface extensions

The new implementation adds three mark classes: `2e-left`, `2e-right` and `2e-right-nonempty` and patches `\markboth` and `\markright` slightly so that they also update these new mark classes, so that the new classes work with existing document classes.

As a result you can use `\LastMark{2e-left}` and `\FirstMark{2e-right}` instead of `\leftmark` and `\rightmark`. But more importantly, you can use any of the other retrieval commands to get a different status value from those marks, e.g., `\LastMark{2e-right}` would return the last subsection on the page (instead of the first as returned by `\rightmark`).

The difference between `2e-right` and `2e-right-nonempty` is that the latter will only be updated if the material for the mark is not empty. Thus `\markboth{title}{}` as issued by, say, `\sectionmark`, sets a `2e-left` mark with `title` and a `2e-right` mark with the empty string but does not add a `2e-right-nonempty` mark.

Thus, if you have a section at the start of a page and you would ask for `\FirstMark{2e-right}` you would get an empty string even if there are subsections on that page. But `2e-right-nonempty` would then give you the first or last subsection

on that page. Of course, nothing is simple. If there are no subsections it would tell you the last subsection from an earlier page. We therefore need comparison tools, e.g., if top and first are identical you know that the value is bogus, i.e., a suitable implementation would be

```
\IfMarksEqualTF{2e-right-nonempty}{top}{first}
{ <appropriate action if there was no real mark> }
{\FirstMark{2e-right-nonempty}}
```

## 5 Notes on the mechanism

In contrast to vanilla  $\text{\TeX}$ ,  $\varepsilon\text{-}\text{\TeX}$  extends the mark system to allow multiple independent marks. However, it does not solve the `\topmark` problem which means that  $\text{\LaTeX}$  still needs to manage marks almost independently of  $\text{\TeX}$ . The reason for this is that the more complex output routine used by  $\text{\LaTeX}$  to handle floats (and related structures) means that `\topmark(s)` remain unreliable. Each time the output routine is fired up,  $\text{\TeX}$  moves `\botmark` to `\topmark`, and while  $\varepsilon\text{-}\text{\TeX}$  extends this to multiple registers the fundamental concept remains the same. That means that the state of marks needs to be tracked by  $\text{\LaTeX}$  itself. An early implementation of this package used  $\text{\TeX}$ 's `\botmark` only to ensure the correct interaction with the output routine (this was before the  $\varepsilon\text{-}\text{\TeX}$  mechanism was even available). However, other than in a prototype implementation for  $\text{\LaTeX}3$ , this package was never made public.

The new implementation now uses  $\varepsilon\text{-}\text{\TeX}$ 's marks as they have some advantages, because with them we can leave the mark text within the galley and only extract the marks during the output routine when we are finally shipping out a page or storing away a column for use in the next page. That means we do not have to maintain a global data structure that we have to keep in sync with informational marks in the galley but can rely on everything being in one place and thus manipulations (e.g. reordering of material) will take the marks with them without a need for updating a fragile linkage.

To allow for completely independent marks we use the following procedure:

- For every type of marks we allocate a mark class so that in the output routine  $\text{\TeX}$  can calculate for each class the current top, first, and bottom mark independently. For this we use `\newmarks`, i.e., one marks register per class.
- As already mentioned firing up an output routine without shipping out a page means that  $\text{\TeX}$ 's top marks get wrong so it is impossible to rely on  $\text{\TeX}$ 's approach directly. What we do instead is to keep track of the real marks (for the last page or more generally last region) in some global variables.
- These variables are updated in the output routine at defined places, i.e., when we do real output processing but not if we use special output routines to do internal housekeeping.
- The trick we use to get correctly updated variables is the following: the material that contains new marks (for example the page to be shipped out) is stored in a box. We then use  $\text{\TeX}$  primitive box splitting functions by splitting off the largest amount possible (which should be the whole box if nothing goes really wrong). While that seems a rather pointless thing to do, it has one important side effect:  $\text{\TeX}$  sets up first and bottom marks for each mark class from the material it has split off. This way we get the first and last marks (if there have been any) from the material in the box.

- The top marks are simply the last marks from the previous page or region. And if there hasn't been a first or bottom mark in the box then the new top mark also becomes new first and last mark for that class.
- That mark data is then stored in global token lists for use during the output routine and legacy commands such as `\leftmark` or new commands such as `\TopMark` simply access the data stored in these token lists.

That's about it in a nutshell. Of course, there are some details to be taken care of—those are discussed in the implementation sections.

## 6 Public interfaces for packages such as **multicol**

The functions in this section are public so that packages can make use of them. However, this must be done with great care, e.g., `\mark_update_structure_from_material:nn` updates the global mark structure and can therefore be used only in places where such an update is meaningful, e.g., in special output routines. Elsewhere, a change to the mark structure would break the whole mechanism and querying the marks would return incorrect data.

---

<code>\mark_update_structure_from_material:nn</code>	<code>\mark_update_structure_from_material:nn {&lt;region&gt;} {&lt;material with marks&gt;}</code>
--	---

---

Helper function that inspects the marks inside the second argument and assigns new mark values based on that to the `<region>` given in the first argument. For this it first copies the mark structure from `<region>` to `previous-<region>` and then takes all last mark values currently in the region and makes them the new top mark values. Finally it assigns new first and last values for all mark classes based on what was found in the second argument.

As a consequence, the allowed values for `<region>` are `page` and `column` because only they have `previous-...` counterparts.

Another important aspect to keep in mind is that marks are recognized only if they appear on the top level, e.g., if we want to process material stored in boxes we need to put it unboxed (using `\unvcopy` etc.) into the second argument.

---

<code>\mark_copy_structure:nn</code>	<code>\mark_copy_structure:nn {&lt;alias&gt;} {&lt;source&gt;}</code>
--------------------------------------	---

---

Helper function that copies all mark values in the `<source>` region to `<alias>`, i.e., make the structures identical. Used to update the `previous-...` structures inside `\mark_update_structure_from_material:nn` and `first-column` and `last-column` structures inside the internal commands `\__mark_update_singlecol_structures:` or `\__mark__update_dbcol_structures:`.

---

<code>\mark_set_structure_to_err:n</code>	<code>\mark_set_structure_to_err:n {&lt;region&gt;}</code>
---	--

---

Helper function that sets all mark values in the `<region>` to an error message. This is currently used for `last-column` at times where using marks from it would be questionable/wrong, i.e., when we have just processed the first column in a two-column document.

---

```
\mark_clear_structure:n \mark_clear_structure:n {\region}
```

---

Helper function that sets all mark values in the  $\langle\textit{region}\rangle$  to empty. This is currently used for `column` when a multicol environment starts; this is because it wouldn't make sense if the top mark in the first column returned the last mark from a previous multicol (which may have been much earlier, with intermediate material).

---

```
\mark_get_marks_for_reinsertion:nnn \mark_get_marks_for_reinsertion:nnn {\source}
                                     \token-list-var for collecting first marks
                                     \token-list-var for collecting last marks
```

---

Helper function for extracting marks that would otherwise get lost, for example when they are hidden inside a box. This helper does not update mark structures and can therefore be used outside the output routine as well.

It collects all the top-level marks from inside the  $\langle\textit{source}\rangle$  and then adds suitable `\mark_insert:nn` commands to each of the two token lists. These token lists can then be executed at the right place to reinsert the marks, e.g., directly after the box. This is, for example, going to be used<sup>46</sup> by `multicol` when a short balanced `multicols` is returned to the galley for typesetting.

If the  $\langle\textit{source}\rangle$  consists of a single vertical box (plus possibly followed by some glue but nothing else) then the box is unpacked and the top-level marks are collected from its content. However, if it is not a vertical box or there are other data then nothing is unpacked and you have to do the unpacking yourself to get at the marks inside.

It is quite likely that one only needs a single token list for returning the `\mark_insert:nn` statements. If that is the case this command may change to take only two arguments.

## 7 Internal functions for the standard output routine of L<sup>A</sup>T<sub>E</sub>X

The functions in this section are tied to the output routine and used in the interface to L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub> and perhaps at some later time within a new output routine for L<sup>A</sup>T<sub>E</sub>X. They are not (yet) meant for general use and are therefore made internal, even though we already use them in `multicol`. Internal means that `@@` automatically gets replaced in the code (and in the documentation) so we have to give it a suitable value.

<sub>1</sub>  $\langle\textit{@@=mark}\rangle$

---

```
\_mark_update_singlecol_structures: \_mark_update_singlecol_structures:
```

---

L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub> integration function in case we are doing single column layouts. It assumes that the page content is already stored in `\@outputbox` and processes the marks inside that box. It is called as part of `\@opcol`.

---

```
\_mark_update_dbcol_structures: \_mark_update_singlecol_structures:
```

---

L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub> integration function mark used when we are doing double column documents. It assumes that the page content is already stored in `\@outputbox` and processes the marks inside that box. It then does different post-processing depending on the start of the switch `\if@firstcolumn`. If we are in the second column it also has to update page marks, otherwise it only updates column marks. It too is called as part of `\@opcol`.

---

<sup>46</sup>Probably not before 2025, though.

## 8 The Implementation

```

2 <*2ekernel | latexrelease>
3 \ExplSyntaxOn
4 <latexrelease>\NewModuleRelease{2022/06/01}{ltmarks}
5 <latexrelease>                {Marks-handling}

```

### 8.1 Allocating new mark classes

---

`\g__mark_classes_seq` A list holding all the mark classes that have been declared.

```

6 \seq_new:N \g__mark_classes_seq

```

`\mark_new_class:n` A mark class is created by initializing a number of data structures. First, we get a register number to refer to the mark class. The new mark class is then added to the `\g__mark_classes_seq` sequence to be able to easily loop over all classes. Finally a number of top-level global token lists are declared that hold various versions of the mark for access.

`\__mark_new_class:nn`

```

7 \cs_new_protected:Npn \mark_new_class:n #1
8 {
9   \seq_if_in:NnTF \g__mark_classes_seq {#1}
10    {
11      \msg_error:nnn { mark } { class-already-defined }
12      {#1}
13    }
14    { \__mark_new_class:nn {#1} }
15 }

```

This is only available in the preamble.

```

16 \@onlypreamble \mark_new_class:n

```

The internal command carries out the necessary allocations.

```

17 \cs_new_protected:Npn \__mark_new_class:nn #1
18 {
19   <*trace>
20   \__mark_debug:n { \iow_term:x { Marks:~new~mark:~#1~\msg_line_context: } }
21   </trace>

```

Use the L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub> interface for now as the L3 programming layer doesn't have one for marks yet.

```

22 \exp_args:Nc \newmarks {c__mark_class_ #1 _mark}

```

Remember the new class in the sequence.

```

23 \seq_gput_right:Nn \g__mark_classes_seq {#1}
24 \__mark_init_region:nn {page}{#1}

```

For the page region we also keep track of the previous-page.

```

25 \__mark_init_region:nn {previous-page}{#1}

```

Same game for column and previous-column

```

26 \__mark_init_region:nn {column}{#1}
27 \__mark_init_region:nn {previous-column}{#1}

```

But for columns we also allocate token lists for the alias regions `first-column` and `last-column`.

```
28 \__mark_init_region:nn {first-column}{#1}
29 \__mark_init_region:nn {last-column}{#1}
```

To support multiple columns produced by the `multicol` package, we preallocate twenty alias regions (since this is the number of columns that `multicol` supports as a maximum). They are filled by copying the current column into the appropriate `mcol-...`

```
30 %fmi \__mark_init_region:nn {mcol}{#1}
31 %fmi \__mark_init_region:nn {previous-mcol}{#1}
32 \__mark_init_region:nn {mcol-1}{#1}
33 \__mark_init_region:nn {mcol-2}{#1}
34 \__mark_init_region:nn {mcol-3}{#1}
35 \__mark_init_region:nn {mcol-4}{#1}
36 \__mark_init_region:nn {mcol-5}{#1}
37 \__mark_init_region:nn {mcol-6}{#1}
38 \__mark_init_region:nn {mcol-7}{#1}
39 \__mark_init_region:nn {mcol-8}{#1}
40 \__mark_init_region:nn {mcol-9}{#1}
41 \__mark_init_region:nn {mcol-10}{#1}
42 \__mark_init_region:nn {mcol-11}{#1}
43 \__mark_init_region:nn {mcol-12}{#1}
44 \__mark_init_region:nn {mcol-13}{#1}
45 \__mark_init_region:nn {mcol-14}{#1}
46 \__mark_init_region:nn {mcol-15}{#1}
47 \__mark_init_region:nn {mcol-16}{#1}
48 \__mark_init_region:nn {mcol-17}{#1}
49 \__mark_init_region:nn {mcol-18}{#1}
50 \__mark_init_region:nn {mcol-19}{#1}
51 \__mark_init_region:nn {mcol-20}{#1}
```

We also have to initialize the `saved-column` region that is used in `multicol`. Perhaps we should have a `\NewMarkRegion` so that it would be possible for other packages to add further regions. But let's wait and see if there is a real use case for new regions before making the interface more general.

```
52 \__mark_init_region:nn {saved-column}{#1}
53 }
```

*(End of definition for `\mark_new_class:n` and `\__mark_new_class:nn`. This function is documented on page 1015.)*

`\__mark_init_region:nn` For each class (#2) and region (#1), we need three token lists: one for top, first, and last.  
`\c__mark_empty_tl` The default value to be returned is “empty”.

```
54 \cs_new_protected:Npn \__mark_init_region:nn #1 #2 {
55 \tl_new:c { g__mark_#1_top_ #2 _tl }
56 \tl_new:c { g__mark_#1_first_ #2 _tl }
57 \tl_new:c { g__mark_#1_last_ #2 _tl }
58 \tl_gset_eq:cN { g__mark_#1_top_ #2 _tl } \c__mark_empty_tl
59 \tl_gset_eq:cN { g__mark_#1_first_ #2 _tl } \c__mark_empty_tl
60 \tl_gset_eq:cN { g__mark_#1_last_ #2 _tl } \c__mark_empty_tl
61 }
```

All marks will have an identification in the form of a number<sup>47</sup> that is incremented each time a mark insertion happens; therefore the initial empty values should also have such a number, so that data extraction will be uniform.

```
62 \tl_const:Nn \c__mark_empty_tl { \__mark_value:nn{0}{} }
```

(End of definition for \\_\_mark\_init\_region:nn and \c\_\_mark\_empty\_tl.)

## 8.2 Updating mark structures

```
\l__mark_box
\l__mark_ii_box
\g__mark_tmp_tl
\g__mark_new_top_tl
```

For some operations we need two temporary private boxes and two private global token lists.

```
63 \box_new:N \l__mark_box
64 \box_new:N \l__mark_ii_box
65 \tl_new:N \g__mark_tmp_tl
66 \tl_new:N \g__mark_new_top_tl
```

(End of definition for \l\_\_mark\_box and others.)

```
\__mark_extract_and_handle_marks:nn
```

This is the main macro to extract and handle marks inside some vertical material. It is used by `\mark_update_structure_from_material:nn` (for updating the mark structure for a region based on the marks found) and by `\mark_get_marks_for_reinsertion:nnn` (for extracting marks from some material and prepare for reinserting them later (e.g., out of a box that is placed as a box into the main galley)).

```
67 \cs_new_protected:Npn \__mark_extract_and_handle_marks:nn #1#2 {
```

This macro expects code to handle extracted marks in its first argument and vertical material (not boxed or just consisting of a single vertical box) as its second. It extracts top-level mark information from #2, stores them as split marks and then calls #1 to make use of this information.

If it finds a forced break in the material it removes it and then restarts the attempt without it.

We start with a group to keep most changes local.

```
68 \group_begin:
```

Getting the first and last marks out of the material in #2 is done by putting the material in a box and then doing a split operation to the maximum size possible (which hopefully gets us all of the content).<sup>48</sup> Because this action is used only to get the mark values, we don't want any underfull box warnings so we (locally) turn those off.

```
69 \dim_set_eq:NN \tex_splitmaxdepth:D \c_max_dim
70 \int_set_eq:NN \tex_vbadness:D \c_max_int
71 \dim_set_eq:NN \tex_vfuzz:D \c_max_dim
```

There is a further complication: if the material contains infinite shrinking glue then a `\vsplit` operation will balk with a low-level error. Now pages or columns, which are our main concern here, can't have such infinite shrinkage if they are cut straight from the galley, however the use of `\enlargethispage` actually does add some at the very bottom (and also wraps the whole page into a box by itself, so if we leave it this way then a) we get this error and b) we don't see any marks because they are hidden one level down).

<sup>47</sup>There are a few cases where special identification strings are used, e.g., `2.09-compat`.

<sup>48</sup>With normal column material cut from the main galley we should always get all material in one go, but in certain situations, for example, in a `multicols` environment that contains some `\columnbreaks` a single split operation will not be enough. Thus, this is something we need to handle.

Another possible issue are packages or user code that place stray `\vboxes` directly into the main galley (an example is `marginnote` that attaches its marginals in this way). If such boxes end up as the last item on the page we should not unpack them.

All these issues need to be handled, which is done in `\__mark_prepare_and_extract:nn`.

```
72      \__mark_prepare_and_extract:nn {#1} {#2}
```

Once all mark classes have been processed, the data structures are updated and we can close the group, which undoes our local changes and retains only the global ones.

```
73      \group_end:
74    }
```

(End of definition for `\__mark_extract_and_handle_marks:nn`.)

`\__mark_prepare_and_extract:nn` This macro does the dirty work. It is not directly integrated in `\__mark_extract_and_handle_marks:nn` because we may have to call it recursively if we find forced breaks.

```
75 \cs_new_protected:Npn \__mark_prepare_and_extract:nn #1#2 {
```

To handle the `\enlargethispage` case we do an `\unskip` to get rid of any glue that is present at the very end of the material and also check if we have then a `\vbox` as the last item and if so unpack that too, but only under certain conditions, see below. All this is temporary done in a group, just for getting the marks out, so it doesn't affect the final page production.

```
76   \vbox_set:Nn \l__mark_box
77   {
78     #2
79     \tex_unskip:D
80     \box_set_to_last:N \l__mark_box
```

After having removed the last box from the current list (if there was one) we check whether the vertical list is now empty. If not, then the last box is definitely not the one from `\enlargethispage` and so we can, and should, leave it alone. Otherwise we check if this last box is a `\vbox`.

```
81     \int_compare:nNt \tex_lastnodetype:D < 0
82     {
83       \box_if_vertical:NT \l__mark_box
```

If it is, we unpack the box.

```
84       { \vbox_unpack:N \l__mark_box }
85     }
```

If it wasn't a `\vbox`, it was either an `\hbox` or there was no box. Given that we are only interested in the marks we don't need put it back in that case.

```
86   }
```

We are now ready to `\vsplit` the box to get at the marks. If the box contains some infinite negative glue the `TEX` will produce an error complaining about it but it will correctly find the split marks. Given that we can't prevent that error, we hide it from the user and ensure that `TEX` doesn't stop. The error message still shows in the log, but even that is mitigated as best as possible—see the definition of `\__mark_vbox_set_split_to_maxdimen:NN` for the tricks employed.

```
87   \__mark_vbox_set_split_to_maxdimen:NN \l__mark_ii_box \l__mark_box
```

After splitting we check if there is anything left in `\l__mark_box`. If not then the above split has set some split marks that we can then use to finish the extraction:

```

88   \box_if_empty:NTF \l__mark_box
89   { #1 }

If we have a remainder after the split then this means that there was some forced break
in the material. We get rid of that by combining the content of the two boxes and restart.

90   {
91   (*trace)
92     \__mark_debug:n { \iow_term:x
93       { Marks:~ mark~ extraction~needs~ recursion~
94         \msg_line_context: } }
95   (/trace)
96     \__mark_prepare_and_extract:nn {#1}
97     { \vbox_unpack:N \l__mark_ii_box
98       \vbox_unpack:N \l__mark_box }
99   }
100 }

```

(End of definition for `\__mark_prepare_and_extract:nn`.)

`\__mark_vbox_set_split_to_maxdimen:NN`

Split a box to get at its marks without pausing even if T<sub>E</sub>X is producing an error message because of infinite negative glue in the box. If there is such an error we ensure that it only shows up in the log but not on the terminal.

With a recent T<sub>E</sub>X engine that knows the primitive `\ignoreprimitiveerror` we can turn this error into a warning (simply by setting this primitive to the value 1).

```

101 \if_cs_exist:N \tex_ignoreprimitiveerror:D

102 \cs_new_protected:Npn \__mark_vbox_set_split_to_maxdimen:NN #1#2 {
103   \tl_set:Nc \l__mark_saved_parameters_tl
104     { \tex_ignoreprimitiveerror:D
105       \int_use:N \tex_ignoreprimitiveerror:D
106       \scan_stop:
107     }
108   \tex_ignoreprimitiveerror:D 1 \scan_stop:
109   \vbox_set_split_to_ht:NNn #1 #2 { \c_max_dim }
110   \l__mark_saved_parameters_tl
111 }

```

With older T<sub>E</sub>X engines we have to make use of David's hack below to render the error (fairly) harmless and prevent T<sub>E</sub>X from stopping. But, of course, the above solution is better because jumping over the error with a local change to the interaction mode still means that T<sub>E</sub>X thinks there was an error in the run so the return code is no longer 0 (and that might affect workflows that want to test for this).

```

112 \else:

```

The nice low-level hack by DPC records in the `.log` that a glue shrinkage error is harmless.

We disguise `\c_max_dim` in an odd looking csname, which then shows up as part of the display of an error message if that error happens. This csname forms part of the error display so what you get is something like

```

! Infinite glue shrinkage found in box being split.
<argument> Infinite shrink error above ignored !
1. ... }

```

which hopefully makes it clear that the error is harmless and should be ignored by the reader of the .log.

```
113 \cs_set_eq:cN {\Infinite~shrink~error~above~ignored~!}\c_max_dim
```

The whole definition of `\__mark_vbox_set_split_to_maxdimen:NN` below is fully expanded, so we have to use a lot of `\exp_not:N` commands to prevent expansion where necessary.

```
114 \cs_new_protected:Npx \__mark_vbox_set_split_to_maxdimen:NN #1#2 {
```

We start by saving the current interaction and escape char settings.

```
115   \tl_set:Nc \exp_not:N \l__mark_saved_parameters_tl
116   {
117     \tex_interactionmode:D
118     \exp_not:N \int_use:N \tex_interactionmode:D \scan_stop:
119     \tex_escapechar:D
120     \exp_not:N \int_use:N \tex_escapechar:D \scan_stop:
121   }
```

Then we change them so that no escape char is printed in the error message (accounts for the missing backslash in front of `Infinite shrink ...`) and we set the interaction to `\nonstopmode` so that the error (if any) just goes into the .log file and T<sub>E</sub>X doesn't stop at that point.

```
122   \tex_escapechar:D      -1 \scan_stop:
123   \tex_interactionmode:D 0 \scan_stop:
```

Then we do the splitting of the box to `\c_max_dim` to get at the marks. This may generate the error we are worried about, i.e., if the box contains infinite negative glue. However, T<sub>E</sub>X makes this glue finite and continues, which means we get our split marks which is really all we care about.

```
124   \tex_setbox:D #1 \tex_vsplit:D #2 to
```

The `\use:n` may seem pointless, and it is to some extent, but we need it to get our disguised `\c_max_dim` displayed properly as part of the error message if there is one. Without it, the display would show only part of what we want it to show (try it).

```
125     \exp_not:N \use:n {
126       \use:c{\Infinite~shrink~error~above~ignored~!}
127     }
```

Finally, we change the escape char and the interaction mode back to what it was before:

```
128   \exp_not:N \l__mark_saved_parameters_tl
129 }
130 \fi:
```

*(End of definition for \\_\_mark\_vbox\_set\_split\_to\_maxdimen:NN.)*

`\l__mark_saved_parameters_tl` The temporary variable used for resetting escape char and interaction mode.

```
131 \tl_new:N \l__mark_saved_parameters_tl
```

*(End of definition for \l\_\_mark\_saved\_parameters\_tl.)*

`\mark_update_structure_from_material:nn` This function updates the mark structures of a region. The first argument is the region to update and second argument receives the material that holds the marks. Out of this material we extract the first and last marks for all classes (if there are any) to do the assignments.

```
132 \cs_new_protected:Npn \mark_update_structure_from_material:nn #1#2 {
133   \__mark_extract_and_handle_marks:nn
```

Once the marks can be extracted we update the structure from the split marks (code in `\_mark_update_structure_from_splitmarks:n`).

```

134     { \_mark_update_structure_from_splitmarks:n {#1} }
135     { #2 }
136 }

```

(End of definition for `\mark_update_structure_from_material:nn`. This function is documented on page 1022.)

This macro is called after we have done a `\tex_vsplit:D` operation and the mark data is in the split marks.

```

137 \cs_new_protected:Npn \_mark_update_structure_from_splitmarks:n #1 {

```

The first thing we do is to copy the current region structure to `previous-...`; this leaves the current structure untouched so we can update it class by class (as is necessary).

```

138   \mark_copy_structure:nn { previous-#1 } {#1}

```

After this action we can get first and last marks of the various classes through `\tex_splitfirstmarks:D` and `\tex_splitbotmarks:D`. So now we loop over all classes stored in `\g__mark_classes_seq`.

```

139   \seq_map_inline:Nn \g__mark_classes_seq
140   {

```

First action: get the last mark from the previous region, i.e., `previous-#1`. But because it is also still inside `#1`, at the moment we use that to construct the name because this is a tiny bit faster. Given that we need this value in various assignments we store it away which avoids unnecessary further csname generations.

```

141       \tl_gset_eq:Nc \g__mark_new_top_tl { g__mark_#1_last_##1_tl }

```

This will first of all become the new top mark for the current class.

```

142       \tl_gset_eq:cN { g__mark_#1_top_##1_tl } \g__mark_new_top_tl

```

Next action is to get ourselves the new last mark from the material supplied.

```

143       \tl_gset:Nc \g__mark_tmp_tl
144       { \tex_splitbotmarks:D \use:c { c__mark_class_##1_mark } }

```

If this mark doesn't exist then obviously neither does the first mark, so both become the last mark from the previous region. We have to be a little careful here: something like `\mark_insert:nn{foo}{}` adds an “empty” mark that should not be confused with no mark at all. But no mark in our material will result in `\g__mark_tmp_tl` being fully empty. This is why we have to make sure that “empty” from `\mark_insert:nn` only appears to be empty when typeset but fails the next test (see below how this is done).

```

145       \tl_if_empty:NTF \g__mark_tmp_tl
146       {
147           \tl_gset_eq:cN { g__mark_#1_last_ ##1_tl }
148           \g__mark_new_top_tl
149           \tl_gset_eq:cN { g__mark_#1_first_##1_tl }
150           \g__mark_new_top_tl
151       }

```

If it wasn't empty, i.e., if it had a real value then we use this value for our new last mark instead.

```

152       {
153           \tl_gset_eq:cN { g__mark_#1_last_##1_tl } \g__mark_tmp_tl

```

Because we had a last mark we also have a first mark (which might be the same, but might be not), so we pick that up and assign it to the appropriate token list. This explains why we first checked for the last mark because that makes the processing faster in case there is none.

```

154         \tl_gset:co { g__mark_#1_first_##1_tl }
155         {
156             \tex_splitfirstmarks:D
157             \use:c { c__mark_class_##1_mark }
158         }
159     }
160 }
161 }

```

(End of definition for `\__mark_update_structure_from_splitmarks:n`.)

`\mark_get_marks_for_reinsertion:nNN`

This function extracts the marks from the material in the first argument but it does not update any the mark structures. Instead, it collects the marks in the token lists given as the second and third argument, in such a way that they can be reinserted by just executing the token lists.<sup>49</sup>

```

162 \cs_new_protected:Npn \mark_get_marks_for_reinsertion:nNN #1#2#3 {

```

First we clear the temporary token lists as we haven't seen any marks yet.

```

163   \tl_gclear:N \g__mark_first_marks_tl
164   \tl_gclear:N \g__mark_last_marks_tl

```

Then we extract all top-level marks, thereby filling the token lists with suitable `\mark_insert:nn` calls.

```

165   \__mark_extract_and_handle_marks:nn

```

The first argument holds the code used for filling the token lists and the second holds the material from which all marks should be extracted.

```

166   \__mark_get_from_splitmarks:
167   { #1 }

```

Finally, we copy the updated (or not updated) temporary token lists to the two that have been supplied when the function was called. By convention “get” operations return their values in local variables and `\__mark_extract_and_handle_marks:nn` runs in a group, which is why we have to use global temporary variables for collecting.

```

168   \tl_set_eq:NN #2 \g__mark_first_marks_tl
169   \tl_set_eq:NN #3 \g__mark_last_marks_tl
170 }

```

(End of definition for `\mark_get_marks_for_reinsertion:nNN`. This function is documented on page 1023.)

`\__mark_get_from_splitmarks:`

This function is called after we have done a `\vsplit` to update the split marks. It loops through all mark classes to find out if there are marks for this class and if so updates the global tls used for collecting.

```

171 \cs_new_protected:Npn \__mark_get_from_splitmarks: {
172   \seq_map_inline:Nn \g__mark_classes_seq
173   {

```

<sup>49</sup>It is probably enough to collect everything in a single token list as long as we put the first marks first and the last marks last). But for extra flexibility, I currently use 2 token lists. This might change when it is really clear that this is never needed.

First we to get the last mark for the current class from the material supplied.

```

174 \tl_gset:No \g__mark_tmp_tl
175 { \tex_splitbotmarks:D \use:c { c__mark_class_##1_mark } }

```

If this mark doesn't exist then obviously first mark doesn't either, so we do nothing (other than issuing some debugging info).

We have to be a little careful here: something like `\mark_insert:nn{foo}{}` adds an “empty” mark that we should not confuse with the case where there is no mark at all.

When there is no mark at all we get a truly empty `\g__mark_tmp_tl` as a result. This is why we have to make sure that an “empty” mark generated with `\mark_insert:nn` only appears to be empty when it is typeset, but fails the next test (see below how this is done).

```

176 \tl_if_empty:NTF \g__mark_tmp_tl
177 {
178   (*trace)
179   \__mark_debug:n { \iow_term:x { Marks:~no~ marks~
180     for~ class~ '##1'~\msg_line_context: } }
181   </trace>
182 }

```

If it wasn't empty, i.e., if it had a real value then we use this value for our new last mark instead. This means we put an appropriate `\mark_insert:nn` statement into `\g__mark_last_marks_tl`.

```

183 {
184   (*trace)
185   \__mark_debug:n { \iow_term:x { Marks:~ extract~ last~

```

The mark content in `\g__mark_tmp_tl` may contain arbitrary code that may react badly if it is expanded in a write. So we better avoid that expansion, otherwise debugging might generate spurious errors when turned on.

```

186   mark~ for~ class~ '##1'~ =~ \exp_not:o \g__mark_tmp_tl } }
187 </trace>
188 \tl_gput_right:Ne \g__mark_last_marks_tl
189 { \mark_insert:nn {##1} { \__mark_drop_id:o { \g__mark_tmp_tl } } }

```

Because we had a last mark we also have a first mark (which might be the same, but might not be), so we pick that up and add it to the `\g__mark_first_marks_tl` token list. This explains why we first checked for the last mark because that makes the processing faster in case there is none.

```

190 (*trace)
191 \__mark_debug:n { \iow_term:x {
192   Marks:~ extract~ first~ mark~ for~ class~ '##1'~ =~

```

Again no expansion for the mark content.

```

193   \exp_not:o {
194     \tex_splitfirstmarks:D
195     \use:c { c__mark_class_##1_mark }
196   }
197 } }
198 </trace>
199 \tl_gput_right:Ne \g__mark_first_marks_tl
200 { \mark_insert:nn {##1}
201   {

```

We better drop the id from the returned value otherwise they will accumulate in the marks when reinserted.

```

202             \__mark_drop_id:o {
203                 \tex_splitfirstmarks:D
204                 \use:c { c__mark_class_##1_mark }
205             }
206         }
207     }
208 }
209 }
210 }

```

(End of definition for \\_\_mark\_get\_from\_splitmarks:.)

\g\_\_mark\_first\_marks\_tl These are two global temporary variables used in the code above.  
\g\_\_mark\_last\_marks\_tl

```

211 \tl_new:N \g__mark_first_marks_tl
212 \tl_new:N \g__mark_last_marks_tl

```

(End of definition for \g\_\_mark\_first\_marks\_tl and \g\_\_mark\_last\_marks\_tl.)

**\mark\_copy\_structure:nn** This function copies the structure for one region to another, e.g., from page to previous-page above, or later from column to first-column, etc.

```

213 \cs_new_protected:Npn \mark_copy_structure:nn #1#2 {

```

This requires a simple loop through all mark classes copying the token list from one name to the next.

```

214   \seq_map_inline:Nn \g__mark_classes_seq
215   {
216       \tl_gset_eq:cc { g__mark_ #1_top_ ##1_tl }
217                   { g__mark_ #2_top_ ##1_tl }
218       \tl_gset_eq:cc { g__mark_ #1_first_ ##1_tl }
219                   { g__mark_ #2_first_ ##1_tl }
220       \tl_gset_eq:cc { g__mark_ #1_last_ ##1_tl }
221                   { g__mark_ #2_last_ ##1_tl }
222   }
223 }

```

(End of definition for \mark\_copy\_structure:nn. This function is documented on page 1022.)

**\mark\_clear\_structure:n** This function sets the structure of one region back to an initial state, so that all classes return an empty value if queried.

```

224 \cs_new_protected:Npn \mark_clear_structure:n #1 {

```

This requires a simple loop through all mark classes.

```

225   \seq_map_inline:Nn \g__mark_classes_seq
226   {
227       \tl_gset_eq:cN { g__mark_ #1_top_ ##1_tl }
228                   \c__mark_empty_tl
229       \tl_gset_eq:cN { g__mark_ #1_first_ ##1_tl }
230                   \c__mark_empty_tl
231       \tl_gset_eq:cN { g__mark_ #1_last_ ##1_tl }
232                   \c__mark_empty_tl
233   }
234 }

```

(End of definition for `\mark_clear_structure:n`. This function is documented on page 1023.)

```
\mark_set_structure_to_err:n A slight variation is to install a fixed error message as the value.
  \__mark_error:n
235 \cs_new_protected:Npn \mark_set_structure_to_err:n #1 {
236   \seq_map_inline:Nn \g__mark_classes_seq
237     {
238     \tl_gset:ce { g__mark_ #1 _top_   ##1 _tl } { \__mark_value:nn{?}{\__mark_error:nn {#1}}
239     \tl_gset:ce { g__mark_ #1 _first_ ##1 _tl } { \__mark_value:nn{?}{\__mark_error:nn {#1}}
240     \tl_gset:ce { g__mark_ #1 _last_  ##1 _tl } { \__mark_value:nn{?}{\__mark_error:nn {#1}}
241     }
242 }
```

Given that this is used in only one place, we could hardwire the argument which would be a bit more compact, but who knows, perhaps we end up with another reason to use this error command elsewhere, so for now we keep the argument.

```
243 \cs_new_protected:Npn \__mark_error:nn #1#2 {
244   \msg_error:nnnn { mark } { invalid-use } {#1} {#2}
245 }
```

(End of definition for `\mark_set_structure_to_err:n` and `\__mark_error:n`. This function is documented on page 1022.)

### 8.3 Placing and retrieving marks

`\mark_insert:nn` This function puts a mark for some `<class>` at the current point.

```
246 \cs_new_protected:Npn \mark_insert:nn #1#2
247 {
248   \seq_if_in:NnTF \g__mark_classes_seq {#1}
249     {
```

We need to pass the evaluated argument into the mark but protected commands should not expand including those protected using the `\protect` approach of L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub>. We also disable `\label` and the like.<sup>50</sup>

At this point the code eventually should get a public (and a kernel) hook instead of a set of hardwired settings.

```
250     \group_begin:
```

Within the group we alter some comments, e.g. `\label` or `\index`, to do the right at this point. This is done in the kernel hook `\@kernel@before@insertmark` which is followed by the public hook `insertmark` that can be used by packages to augment or alter that setup as necessary.

```
251     \@kernel@before@insertmark
252     \hook_use:n { insertmark }
253     \unrestored@protected@xdef \g__mark_tmp_tl
254     {
```

To ensure that marks are unique we insert a hidden sequence marker at the beginning of the content of the mark containing the sequence number of the mark.

```
255         \__mark_value:nn{ \int_use:N\g__mark_int }{#2}
256     }
257     <*trace>
258     \__mark_debug:n{ \iow_term:x { Marks:~ set~#1~<--
```

<sup>50</sup>Straight copy from `latex.ltx` but is this even correct? At least a label in a running header makes little sense if it get set several times! Maybe that needs looking at in the 2e kernel.

```

259         '\tl_to_str:V \g__mark_tmp_tl' ~ \msg_line_context: } }
260 \trace>
261 \tex_marks:D \use:c { c__mark_class_ #1 _mark }
262 {

```

Here is the trick to avoid truly empty marks: if the result from the above processing is empty we add something which eventually becomes empty, but not immediately; otherwise we just put `\g__mark_tmp_tl` in.

```

263 % This is no longer needed with 1.0f
264 % \tl_if_empty:NTF \g__mark_tmp_tl
265 % { \exp_not:n { \prg_do_nothing: } }
266 % { \exp_not:o { \g__mark_tmp_tl } }
267 \exp_not:o { \g__mark_tmp_tl }
268 }
269 \group_end:

```

A mark introduces a possible break point and in certain situations that should not happen in vertical mode in L<sup>A</sup>T<sub>E</sub>X. This may need some checking and possibly cleanup ....

```

270 \if@nobreak\ifvmode\nobreak\fi\fi
271 }

```

If the mark class was not known, raise an error.

```

272 {
273 \msg_error:nnx { mark } { unknown-class }
274 { \tl_to_str:n {#1} }
275 }
276 }

```

(End of definition for `\mark_insert:nn`. This function is documented on page 1015.)

`\__mark_value:nn` A hidden marker is placed into every mark added by `\mark_insert:nn`. It will not show up in the output but its argument (a counter value that is incremented) makes all marks unique so the test for “equal” is not fooled by two different marks having the same mark text.

```

277 \cs_new_protected:Npn \__mark_value:nn #1#2 { #2 }

```

(End of definition for `\__mark_value:nn`.)

`\@kernel@before@insertmark` By default `\label`, `\index`, and `\glossary` do nothing when the mark is inserted.

```

insertmark 278 \int_new:N \g__mark_int
279 \cs_new:Npn \@kernel@before@insertmark {
280 \cs_set_eq:NN \label \scan_stop:
281 \cs_set_eq:NN \index \scan_stop:
282 \cs_set_eq:NN \glossary \scan_stop:

```

We count each mark and use that to place a hidden marker in front of the mark text. To ensure that there is no overflow (very unlikely but you never know) we restart every 100000 marks. Thus, if somebody puts more than that number of marks on a single page you could construct a scenario in which that approach fails.

```

283 \int_compare:nNnTF \g__mark_int < {99999}
284 { \int_gincr:N \g__mark_int }
285 { \int_gzero:N \g__mark_int }
286
287 }

```

The public hook to augment the setup.

```
288 \hook_new:n {insertmark}
```

(End of definition for \@kernel@before@insertmark and insertmark.)

`\mark_use_top:nn` To retrieve the first, last or top region mark, we grab the appropriate value stored in the corresponding token list variable and pass its contents back. These functions should be used only in output routines and only after `\mark_update_structure_from_material:nn` has acted, otherwise their value will be wrong.

```
289 \cs_new:Npn \mark_use_first:nn #1#2 { \__mark_use_check:nnn { g__mark_#1_first_#2_tl } {#1} {#2} }
290 \cs_new:Npn \mark_use_last:nn #1#2 { \__mark_use_check:nnn { g__mark_#1_last_#2_tl } {#1} {#2} }
291 \cs_new:Npn \mark_use_top:nn #1#2 { \__mark_use_check:nnn { g__mark_#1_top_#2_tl } {#1} {#2} }
```

If used with an unknown class or region these commands will generate an error. If that happens in an expandable context then the error generation is delayed (e.g., if used in a `\section`) and happens when the code is finally used in typesetting, e.g., in the TOC or a running header. If used in a `\typeout` you only see something like `\__mark_error:n{page}`. This is not too good, but probably better than low-level errors, I guess, and I don't want to use an expandable error because of the size restrictions in such error messages.

```
292 \cs_new:Npn \__mark_use_check:nnn #1#2#3 {
293   \tl_if_eq:cNTF {#1} \relax
294     { \__mark_error:nn {#2} {#3} }
295     { \__mark_drop_id:v {#1} }
296 }
```

Each mark starts with an id and while the id does not print it is nevertheless better to remove it when returning the mark, so that downstream manipulation of the data doesn't have to deal with it. This is what the `\exp_not:o` accomplishes.

```
297 \cs_new:Npn \__mark_drop_id:n #1 { \exp_not:o { #1 } }
298 \cs_generate_variant:Nn \__mark_drop_id:n { o, v }
```

(End of definition for `\mark_use_top:nn`, `\mark_use_first:nn`, and `\mark_use_last:nn`. These functions are documented on page 1016.)

## 8.4 Comparing mark values

`\mark_if_eq:nnnnTF` Test if in a given region (`#1`) for a given class (`#2`) the marks in position `#3` and `#4` (top, first, or last) are identical

```
299 \prg_new_conditional:Npnn \mark_if_eq:nnnn #1#2#3#4 { T , F , TF }
300 {
301   \tl_if_eq:ccTF { g__mark_ #1 _#3_ #2 _tl }
302     { g__mark_ #1 _#4_ #2 _tl }
303     \prg_return_true:
304     \prg_return_false:
305 }
```

The fully general test (with two triplets of the form `<region>`, `<class>`, and `<position>`) is this:

```
306 \prg_new_conditional:Npnn \mark_if_eq:nnnnnn #1#2#3#4#5#6 { T , F , TF }
307 {
308   \tl_if_eq:ccTF { g__mark_ #1 _#3_ #2 _tl }
309     { g__mark_ #4 _#6_ #5 _tl }
310     \prg_return_true:
311 }
```

```

311             \prg_return_false:
312     }

```

(End of definition for `\mark_if_eq:nnnnTF` and `\mark_if_eq:nnnnnnTF`. These functions are documented on page [1016](#).)

## 8.5 Messages

Mark errors are L<sup>A</sup>T<sub>E</sub>X kernel errors:

```

313 \prop_gput:Nnn \g_msg_module_type_prop { mark } { LaTeX }
314 \msg_new:nnnn { mark } { class-already-defined }

```

## 8.6 Debugging the mark structures

Code and commands in this section are not final, it needs more experimentation to see what kind of tracing information is going to be useful in practice. For now the tracing is mainly meant to be used for code testing and not so much for application testing.

It is quite likely that the commands and the behavior of the tracing might change in the future once we gained some experience with it.

```

\g__mark_debug_bool Holds the current debugging state.
339 \bool_new:N \g__mark_debug_bool

```

(End of definition for `\g__mark_debug_bool`.)

```

\mark_debug_on: Turns debugging on and off by redefining \__mark_debug:n.
\mark_debug_off:
\__mark_debug:n
\__mark_debug_gset:
340 \cs_new_eq:NN \__mark_debug:n \use_none:n
341 \cs_new_protected:Npn \mark_debug_on:
342 {
343   \bool_gset_true:N \g__mark_debug_bool
344   \__mark_debug_gset:
345 }
346 \cs_new_protected:Npn \mark_debug_off:
347 {
348   \bool_gset_false:N \g__mark_debug_bool
349   \__mark_debug_gset:
350 }
351 \cs_new_protected:Npn \__mark_debug_gset:
352 {
353   \cs_gset_protected:Npx \__mark_debug:n ##1
354   { \bool_if:NT \g__mark_debug_bool {##1} }
355 }

```

(End of definition for \mark\_debug\_on: and others. These functions are documented on page 1019.)

\DebugMarksOn CamelCase commands for debugging.

```

\DebugMarksOff
356 \cs_new_eq:NN \DebugMarksOn \mark_debug_on:
357 \cs_new_eq:NN \DebugMarksOff \mark_debug_off:

```

(End of definition for \DebugMarksOn and \DebugMarksOff. These functions are documented on page 1019.)

\\_\_mark\_class\_status:nnn Shows the mark values across all regions for one mark class (#2).

The first argument gives some *info* to help in identifying where the command was called, the second is the class and the third holds the number of mcol-... we should display: inside a multicols environment this will be \col@number, in L<sup>A</sup>T<sub>E</sub>X's normal output routines it will be 0.

```

358 <*trace>
359 \cs_new_protected:Npn \__mark_class_status:nnn #1#2#3 {
360   \typeout{ Marks:~#2~ #1:}
361   \__mark_region_status:nnn {#2}{ page~ (previous) } { previous-page }
362   \__mark_region_status:nnn {#2}{ page~ (current)~ } { page }
363   \__mark_region_status:nnn {#2}{ column~ (previous) }{ previous-column }
364   \__mark_region_status:nnn {#2}{ column~ (current)~ }{ column }
365   \__mark_region_status:nnn {#2}{ column~ (first) } { first-column }
366   \__mark_region_status:nnn {#2}{ column~ (last)~ } { last-column }

```

Then finish by displaying a subset of the mcol-... regions: none (0) in the standard L<sup>A</sup>T<sub>E</sub>X output routine and \col@number within a multicols environment.

```

367   \int_step_inline:nn {#3}
368   {
369     \__mark_region_status:nnn {#2}{ column~ (##1)~ } { mcol-##1 }
370   }
371 }

```

(End of definition for \\_\_mark\_class\_status:nnn.)

`\__mark_region_status:nnn` Display the top, first, and last mark of a region unless none of them exist or all of them are empty.

```

372 \cs_new_protected:Npn \__mark_region_status:nnn #1#2#3 {
373   \group_begin:
374   \cs_set:Npn \__mark_value:nn ##1##2{ \exp_not:n{ {##1} ~ ##2 } }
375   \tl_if_exist:cT { g__mark_#3_last_ #1 _tl }
376   {
377     \tl_if_eq:cNF { g__mark_#3_last_ #1 _tl } \c__mark_empty_tl
378     {
379       \typeout{\@spaces #2 =
380         ~|~ \use:c { g__mark_#3_top_ #1 _tl } ~|~
381         \use:c { g__mark_#3_first_ #1 _tl } ~|~
382         \use:c { g__mark_#3_last_ #1 _tl } ~|
383       }
384     }
385   }
386   \group_end:
387 }

```

*(End of definition for \\_\_mark\_region\_status:nnn.)*

`\__mark_status:nn` Show a snapshot of all mark class values across all regions. The first argument is a string to identify the output, the second argument is the number of `mcol-...` regions to show. Outside of a `multicols` environment this is normally set to 0.

```

388 \cs_new_protected:Npn \__mark_status:nn #1#2
389 {
390   \seq_map_inline:Nn \g__mark_classes_seq
391   { \__mark_class_status:nnn {#1} {##1} {#2} }
392 }
393 </trace>

```

*(End of definition for \\_\_mark\_status:nn.)*

`\ShowMarksAt` Debugging helper that displays a snapshot of all known mark structures. The first argument is a text string that is displayed to help identifying when the snapshot was made. The optional second one determines how many `mcol-...` regions are displayed (by default 4).

This may not stay like this (or at all), which is why it isn't yet documented as an official command.

```

394 \NewDocumentCommand \ShowMarksAt {m O{4}} { {
395   <*trace>
396   \__mark_debug:n { \__mark_status:nn {#1}{#2} }
397   </trace>
398 }

```

*(End of definition for \ShowMarksAt.)*

## 8.7 Designer-level interfaces

`\NewMarkClass` These two are identical to the L3 programming layer commands.

`\InsertMark`

```

399 \cs_new_eq:NN \NewMarkClass \mark_new_class:n
400 \@onlypreamble \NewMarkClass
401 \cs_new_eq:NN \InsertMark \mark_insert:nn

```

(End of definition for `\NewMarkClass` and `\InsertMark`. These functions are documented on page 1015.)

`\TopMark` `\FirstMark` `\LastMark` The following commands take an optional argument that defaults to page. There is no checking that the region is actually valid. If not there is simply an empty return.

```

402 \NewExpandableDocumentCommand \FirstMark { 0{page} m }
403     { \mark_use_first:nn {#1}{#2} }
404 \NewExpandableDocumentCommand \LastMark { 0{page} m }
405     { \mark_use_last:nn {#1}{#2} }
406 \NewExpandableDocumentCommand \TopMark { 0{page} m }
407     { \mark_use_top:nn {#1}{#2} }

```

(End of definition for `\TopMark`, `\FirstMark`, and `\LastMark`. These functions are documented on page 1016.)

`\IfMarksEqualTF` `\IfMarksEqualT` `\IfMarksEqualF` We only provide CamelCase commands for the case with one region (optional) and one class. One could think of also providing a version for the general case with several optional arguments, but use cases for this are most likely rare, so not done yet.

```

408 \NewExpandableDocumentCommand \IfMarksEqualTF {0{page}mmm} {
409     \mark_if_eq:nnnnTF {#1}{#2}{#3}{#4}
410 }
411 \NewExpandableDocumentCommand \IfMarksEqualT {0{page}mmm} {
412     \mark_if_eq:nnnnT {#1}{#2}{#3}{#4}
413 }
414 \NewExpandableDocumentCommand \IfMarksEqualF {0{page}mmm} {
415     \mark_if_eq:nnnnF {#1}{#2}{#3}{#4}
416 }

```

(End of definition for `\IfMarksEqualTF`, `\IfMarksEqualT`, and `\IfMarksEqualF`. These functions are documented on page 1016.)

## 9 L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub> integration

### 9.1 Core L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub> integration

`\_mark\_update\_singlecol\_structures:` This command updates the mark structures if we are producing a single column document.

```

417 \cs_new_protected:Npn \_mark\_update\_singlecol\_structures: {

```

First we update the page region (which also updates the previous-page).

The `\@outputbox` is normally in `\vbox` in L<sup>A</sup>T<sub>E</sub>X but we can't take that for granted (an `amsmath` test document changed it to an `\hbox` just to trip me up) so we are a little careful with unpack now.

```

418     \box_if_vertical:NTF \@outputbox
419     {
420         \mark_update_structure_from_material:nn {page}
421         { \vbox_unpack:N \@outputbox }
422     }
423     {
424         \mark_update_structure_from_material:nn {page}
425         { \hbox_unpack:N \@outputbox }
426     }

```

Then we provide the necessary updates for the aliases.

```

427 \mark_copy_structure:nn {previous-column}{previous-page}
428 \mark_copy_structure:nn {column}{page}
429 \mark_copy_structure:nn {first-column}{page}
430 \mark_copy_structure:nn {last-column}{page}
431 <{*trace}
432 % move this into status itself?
433 \__mark_debug:n
434 {
435     \__mark_status:nn
436     { in~ OR~ (
437         \legacy_if:nTF {@twoside}
438         { twoside-
439             \int_if_odd:nTF \c@page
440             { odd }{ even }
441         }
442         { onside }
443     )
444 }
445 {0}
446 }
447 </trace>
448 }

```

(End of definition for \\_\_mark\_update\_singlecol\_structures:.)

\\_\_mark\_update\_dbcol\_structures: This commands handles the updates if we are doing two-column pages.

```

449 \cs_new_protected:Npn \__mark_update_dbcol_structures: {

```

First we update the column and previous-column regions using the material assembled in \@outputbox.

```

450 \box_if_vertical:NTF \@outputbox
451 {
452     \mark_update_structure_from_material:nn {column}
453     { \vbox_unpack:N \@outputbox }
454 }
455 {
456     \mark_update_structure_from_material:nn {column}
457     { \hbox_unpack:N \@outputbox }
458 }

```

How we have to update the alias regions depends on whether or not \@opcol was called to process the first column or to produce the completed page

```

459 \legacy_if:nTF {@firstcolumn}
460 {

```

If we are processing the first column then column is our first-column and there is no last-column yet, so we make those an error.

```

461     \mark_copy_structure:nn {first-column}{column}
462     \mark_set_structure_to_err:n {last-column}
463 }
464 {

```

If we produce the completed page then the `first-column` is the same as the new `previous-column`. However, the structure should already be correct if you think about it (because it was set to `column` last time which is now the `previous-column`), thus there is no need to make an update.

```
465 % \mark_copy_structure:nn {first-column}{previous-column}
```

However, we now have a proper `last-column` so we assign that.

```
466 \mark_copy_structure:nn {last-column}{column}
```

What now remains doing is to update the `page` and `previous-page` regions. For this we have to copy the settings in `page` into `previous-page` and then update `page` such that the top and first marks are taken from the `first-column` region and the last marks are taken from the `last-column` region. All this has to be done for all mark classes so we loop over our sequence.

Note that one loop is needed if we arrange the copy statements in a suitable way.

```
467 \seq_map_inline:Nn \g__mark_classes_seq
468 {
```

The `previous-page` updates need to come before the updates for `page` region because otherwise the values to copy are already overwritten. necessary values.

```
469 \tl_gset_eq:cc { g__mark_previous-page_top_ ##1 _tl }
470 { g__mark_page_top_ ##1 _tl }
471 \tl_gset_eq:cc { g__mark_previous-page_first_ ##1 _tl }
472 { g__mark_page_first_ ##1 _tl }
473 \tl_gset_eq:cc { g__mark_previous-page_last_ ##1 _tl }
474 { g__mark_page_last_ ##1 _tl }
```

To update the top we only have to copy what is in `first-column`:

```
475 \tl_gset_eq:cc { g__mark_page_top_ ##1 _tl }
476 { g__mark_first-column_top_ ##1 _tl }
477
```

Updating the `first` mark for the `page` region is more complicated. We first have to find out if there is any mark in the first column (this can be done by comparing the top and the `first` mark of that region).

```
478 \tl_if_eq:ccTF { g__mark_first-column_top_ ##1 _tl }
479 { g__mark_first-column_first_ ##1 _tl }
480 {
```

If there is no mark in the first column we copy the first mark of the last column. If that doesn't contain a mark we still get the right result because the first mark is then equal to the top mark.

```
481 \tl_gset_eq:cc { g__mark_page_first_ ##1 _tl }
482 { g__mark_last-column_first_ ##1 _tl }
483 }
484 {
```

On the other hand, if there is a mark in the first column we copy over the `first` mark from that column.

```
485 \tl_gset_eq:cc { g__mark_page_first_ ##1 _tl }
486 { g__mark_first-column_first_ ##1 _tl }
487 }
```

The logic for the `last` page mark is again simple, we can just copy the value in the `last` mark of the last column. If that column doesn't contain any marks, then the value in `last` will be automatically the same as the `last` from the first column.

```

488         \tl_gset_eq:cc { g__mark_page_last_      ##1 _tl }
489                     { g__mark_last-column_last_ ##1 _tl }
490     }
491 }
492 < *trace >
493     \__mark_debug:n
494     {
495         \__mark_status:nn
496         { in~ OR~ (
497             \legacy_if:nTF {@twoside}
498             { twoside-
499                 \int_if_odd:nTF \c@page
500                 { odd }{ even }
501             }
502             { onside }
503             \space
504             \legacy_if:nTF {@firstcolumn}
505             { first~ }{ second~ }
506             column )
507         }
508         {0}
509     }
510 < /trace >
511 }

```

(End of definition for `\__mark_update_dblcol_structures:.`)

## 9.2 Other L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub> output routines

This section will cover support for packages that alter the L<sup>A</sup>T<sub>E</sub>X output routine (as necessary). The support for multicols (for now) is handled directly in that package.

```

512 < @@= >

\@expl@@@mark@update@singlecol@structures@@
513 \cs_new_eq:NN \@expl@@@mark@update@singlecol@structures@@

(End of definition for `\@expl@@@mark@update@dblcol@structures@@.`)

### 9.3 Rollback information

```
517 <latexrelease>\IncludeInRelease{0000/00/00}{ltmarks}%  
518 <latexrelease>                                {Undo~Marks~handling}  
519 <latexrelease>
```

We keep the interface commands around even if we roll back in case they are used in packages that don't roll back. Not likely to do a lot of good, but then there is not much we can do, but this at least they won't give unknown csname errors.

```
520 <latexrelease>\DeclareRobustCommand \NewMarkClass[1]{}  
521 <latexrelease>\DeclareRobustCommand \InsertMark[2]{}  
522 <latexrelease>\RenewExpandableDocumentCommand \FirstMark { 0{ } m } { }  
523 <latexrelease>\RenewExpandableDocumentCommand \LastMark { 0{ } m } { }  
524 <latexrelease>\RenewExpandableDocumentCommand \TopMark { 0{ } m } { }  
525 <latexrelease>\RenewExpandableDocumentCommand \IfMarksEqualTF { 0{ } mmm }{ }  
526 <latexrelease>
```

Same here, this avoided extra roll back code in the OR.

## File 49

# ltpage.dtx

## 1 Page styles and related commands

### 1.1 Page Style Commands

`\pagestyle{<style>}` : sets the page style of the current and succeeding pages to *style*

`\thispagestyle{<style>}` : sets the page style of the current page only to *style*.

To define a page style *style*, you must define `\ps@style` to set the page style parameters.

### 1.2 How a page style makes running heads and feet

The `\ps@...` command defines the macros `\@oddhead`, `\@oddfoot`, `\@evenhead`, and `\@evenfoot` to define the running heads and feet. (See output routine.) To make headings determined by the sectioning commands, the page style defines the commands `\chaptermark`, `\sectionmark`, etc., where `\chaptermark{<text>}` is called by `\chapter` to set a mark. The `\...mark` commands and the `\...head` macros are defined with the help of the following macros.

(All the `\...mark` commands should be initialized to no-ops.)

### 1.3 marking conventions

L<sup>A</sup>T<sub>E</sub>X extends T<sub>E</sub>X's `\mark` facility by producing two kinds of marks a 'left' and a 'right' mark, using the following commands:

`\markboth{<left>}{<right>}` : Adds both marks.

`\markright{<right>}` : Adds a 'right' mark.

`\leftmark` : Used in the output routine, gets the current 'left' mark. Works like T<sub>E</sub>X's `\botmark`.

`\rightmark` : Used in the output routine, gets the current 'right' mark. Works like T<sub>E</sub>X's `\firstmark`. The marking commands work reasonably well for right marks 'numbered within' left marks—e.g., the left mark is changed by a `\chapter` command and the right mark is changed by a `\section` command. However, it does produce somewhat anomalous results if 2 `\markboth`'s occur on the same page.

Commands like `\tableofcontents` that should set the marks in some page styles use a `\@mkboth` command, which is `\let` by the `\pagestyle` command (`\ps@...`) to `\markboth` for setting the heading or to `\@gobbletwo` to do nothing.

1 <\*2ekernel>

`\pagestyle` User command to set the page style for this and following pages.

```
2 \def\pagestyle#1{%
3   \@ifundefined{ps@#1}%
4     \undefinedpagestyle
5     {\@nameuse{ps@#1}}}
```

(End of definition for `\pagestyle`.)

`\thispagestyle` User command to set the page style for this page only.

```

6 \def\thispagestyle#1{%
7   \ifundefined{ps@#1}%
8     \undefinedpagestyle
9     {\global\@specialpagetrue\gdef\@specialstyle{#1}}}
```

*(End of definition for \thispagestyle.)*

`\ps@empty` The empty page style: No head or foot line.

```

10 \def\ps@empty{%
11   \let\@mkboth\@gobbletwo\let\@oddhead\@empty\let\@oddfoot\@empty
12   \let\@evenhead\@empty\let\@evenfoot\@empty}
```

*(End of definition for \ps@empty.)*

`\ps@plain` The plain page style: No head, centred page number in foot.

```

13 \def\ps@plain{\let\@mkboth\@gobbletwo
14   \let\@oddhead\@empty\def\@oddfoot{\reset@font\hfil\thepage
15   \hfil}\let\@evenhead\@empty\let\@evenfoot\@oddfoot}
```

*(End of definition for \ps@plain.)*

`\@leftmark` We implement `\@leftmark` and `\@rightmark` in terms of already defined commands to  
`\@rightmark` save token space. We can't get rid of them since they are sometimes used in applications.

```

16 \let\@leftmark\@firstoftwo
17 \let\@rightmark\@secondoftwo
```

*(End of definition for \@leftmark and \@rightmark.)*

```

18 </2ekernel>

```

## File 50

# ltclass.dtx

## 1 Introduction

This file implements the following declarations, which replace `\documentstyle` in  $\text{\LaTeX} 2_{\epsilon}$  documents.

Note that old documents containing `\documentstyle` will be run using a compatibility option—thus keeping everyone happy, we hope!

The overall idea is that there are two types of ‘style files’: ‘class files’ which define elements and provide a default formatting for them; and ‘packages’ which provide extra functionality. One difference between  $\text{\LaTeX} 2_{\epsilon}$  and  $\text{\LaTeX} 2.09$  is that  $\text{\LaTeX} 2_{\epsilon}$  packages may have options. Note that options to classes/packages may be implemented such that they input files, but these file names are not necessarily directly related to the option name.

## 2 User interface

```
\documentclass[<main-option-list>]{<class>}[<version>]
```

There must be exactly one such declaration, and it must come first. The *<main-option-list>* is a list of options which can modify the formatting of elements which are defined in the *<class>* file as well as in all following `\usepackage` declarations (see below). The *<version>* is a version number, beginning with a date in the format YYYY/MM/DD. If an older version of the class is found, a warning is issued.

```
\documentstyle[<main-option-list>]{<class>}[<version>]
```

The `\documentstyle` declaration is kept in order to maintain upward compatibility with  $\text{\LaTeX} 2.09$  documents. It is similar to `\documentclass`, but it causes all options in *<main-option-list>* that the *<class>* does not use to be passed to `\RequirePackage` after the options have been processed. This maintains compatibility with the 2.09 behaviour. Also a flag is set to indicate that the document is to be processed in  $\text{\LaTeX} 2.09$  compatibility mode. As far as most packages are concerned, this only affects the warnings and errors  $\text{\LaTeX}$  generates. This flag does affect the definition of font commands, and `\sloppy`.

```
\usepackage[<package-option-list>]{<package-list>}[<version>]
```

There can be any number of these declarations. All packages in *<package-list>* are called with the same options.

Each *<package>* file defines new elements (or modifies those defined in the *<class>*), and thus extends the range of documents which can be processed. The *<package-option-list>* is a list of options which can modify the formatting of elements defined in the *<package>* file. The *<version>* is a version number, beginning with a date in the format YYYY/MM/DD. If an older version of the package is found, a warning is issued.

Each package is loaded only once. If the same package is requested more than once, nothing happens, unless the package has been requested with options that were not given the first time it was loaded, in which case an error is produced.

As well as processing the options given in the  $\langle\text{package-option-list}\rangle$ , each package processes the  $\langle\text{main-option-list}\rangle$ . This means that options that affect all of the packages can be given globally, rather than repeated for every package.

Note that class files have the extension `.cls`, packages have the extension `.sty`.

`filecontents` (*env.*)

The environment `filecontents` is intended for passing the contents of packages, options, or other files along with a document in a single file. It has one argument, which is the name of the file to create. If that file already exists (maybe only in the current directory if the OS supports a notion of a ‘current directory’ or ‘default directory’) then nothing happens (except for an information message) and the body of the environment is bypassed. Otherwise, the body of the environment is written verbatim to the file name given as the first argument, together with some comments about how it was produced.

The environment can also be called with an optional argument which is used to alter some of its behavior: option `force` or `overwrite` will allow for overwriting existing files, option `nosearch` will only check the current directory when looking if the file exists. This can be useful if you want to generate a local (modified) copy of some file that is already in the search tree of  $\text{\TeX}$ . Finally, you can use `noheader` to prevent it from writing the standard blurb at the top of the file (this is actually the same as using the star form of the environment).

As the environment is intended to be used on document level to bundle different files together, by default it refuses to overwrite files. If the option `force` is used then it always writes the file, but it generates a warning if it overwrites (or might overwrite) an existing file.<sup>51</sup> If necessary, this warning can be suppressed by also using the option `nowarn` but for most use cases we recommend informing the user when an overwrite happens and therefore to not add this option.

The environment is now allowed anywhere in the document, but to ensure that all the necessary packages and options are available when the document is run, it is normally best to place it at the top of your file (before `\documentclass`). A possible use case for using it inside the document body is if you want to reuse some text several times in the document you could then write it and later use `\input` to retrieve it where needed.

The begin and end tags should each be on a line by itself.

## 2.1 Option processing

When the options are processed, they are divided into two types: *local* and *global*:

- For a class, the options in the `\documentclass` command are local.
- For a package, the options in the `\usepackage` command are local, and the options in the `\documentclass` command are global.

The options for `\documentclass` and `\usepackage` are processed in the following way:

1. The local and global options that have been declared (using `\DeclareOption` as described below) are processed first.

In the case of `\ProcessOptions`, they are processed in the order that they were declared in the class or package.

In the case of `\ProcessOptions*`, they are processed in the order that they appear in the option-lists. First the global options, and then the local ones.

---

<sup>51</sup> $\text{\TeX}$  might see a file in the `texmf/` tree that is not in current directory, in which case no overwrite happens; but it can’t distinguish that case from the one in which an overwrite takes place.

2. Any remaining local options are dealt with using the default option (declared using the `\DeclareOption*` declaration described below). For document classes, this usually does nothing, but records the option on a list of unused options. For packages, this usually produces an error.

Finally, when `\begin{document}` is reached, if there are any global options which have not been used by either the class or any package, the system will produce a warning.

## 3 Class and Package interface

### 3.1 Class name and version

`\ProvidesClass` A class can identify itself with the `\ProvidesClass{<name>}[<version>]` command. The `<version>` should begin with a date in the format `YYYY/MM/DD`.

### 3.2 Package name and version

`\ProvidesPackage` A package can identify itself with the `\ProvidesPackage{<name>}[<version>]` command. The `<version>` should begin with a date in the format `YYYY/MM/DD`.

### 3.3 Requiring other packages

`\RequirePackage` Packages or classes can load other packages using `\RequirePackage[<options>]{<name>}[<version>]`. If the package has already been loaded, then nothing happens unless the requested options are not a subset of the options with which it was loaded, in which case an error is called.

`\LoadClass` Similar to `\RequirePackage`, but for classes, may not be used in package files.

`\PassOptionsToPackage` Packages can pass options to other packages using:

`\PassOptionsToPackage{<options>}{<package>}`.

`\PassOptionsToClass` This adds the `<options>` to the options list of any future `\RequirePackage` or `\usepackage` command. For example:

```
\PassOptionsToPackage{foo,bar}{fred}
```

is the same as:

```
\RequirePackage[foo,bar,baz]{fred}
```

`\LoadClassWithOptions` `\LoadClassWithOptions{<name>}[<version>]:`

This is similar to `\LoadClass`, but it always calls class `<name>` with exactly the same option list that is being used by the current class, rather than an option explicitly supplied or passed on by `\PassOptionsToClass`. `\RequirePackageWithOptions` is the analogous command for packages.

This is mainly intended to allow one class to simply build on another, for example:

```
\LoadClassWithOptions{article}
```

This should be contrasted with the slightly different construction

```
\DeclareOption*{\PassOptionsToClass{CurrentOption}{article}}
\ProcessOptions
\LoadClass{article}
```

As used here, the effects are more or less the same, but the version using `\LoadClassWithOptions` is slightly quicker (and less to type). If, however, the class declares options of its own then the two constructions are different; compare, for example:

```
\DeclareOption{landscape}{...}
\ProcessOptions
\LoadClassWithOptions{article}
```

with:

```
\DeclareOption{landscape}{...}
\DeclareOption*{\PassOptionsToClass{\CurrentOption}{article}}
\ProcessOptions
\LoadClass{article}
```

In the first case, the `article` class will be called with option `landscape` precisely when the current class is called with this option; but in the second example it will not as in that case `article` is only passed options by the default option handler, which is not used for `landscape` as that option is explicitly declared.

```
\IfPackageLoadedTF      To find out if a package has already been loaded, use
\IfClassLoadedTF        \IfPackageLoadedTF{<package>}{<true>}{<false>}
\@ifpackageloaded
\@ifclassloaded
```

or the old name `\@ifpackageloaded`.

```
\IfPackageAtLeastTF    To find out if a package has already been loaded with a version equal to or more
\IfClassAtLeastTF      recent than <date>, use
\IfFileAtLeastTF
\@ifpackagelater        \IfPackageAtLeastTF{<package>}{<date>}{<true>}{<false>}
\@ifclasslater          or the old name \@ifpackagelater.
\IfFormatAtLeastTF     To test the format date use
                        \IfFormatAtLeastTF{<date>}{<true>}{<false>}
```

```
\IfPackageLoadedWithOptionsTF  To find out if a package has already been loaded with at least the options <options>,
\IfClassLoadedWithOptionsTF use
\@ifpackagewith                \IfPackageLoadedWithOptionsTF{<package>}{<options>}{<true>}{<false>}
\@ifclasswith
```

or the old name `\@ifpackagewith`.

There exists one package that can't be tested with the above commands: the `fontenc` package pretends that it was never loaded to allow for repeated reloading with different options (see `ltoutenc.dtx` for details).

```
\NeedsDocumentMetadata  To require that a document starts with \DocumentMetadata use
                        \NeedsDocumentMetadata
```

### 3.4 Declaring new options

Options for classes and packages are built using the same macros.

<code>\DeclareOption</code>	To define a builtin option, use <code>\DeclareOption{&lt;name&gt;}{&lt;code&gt;}</code> .
<code>\DeclareOption*</code>	To define the default action to perform for local options which have not been declared, use <code>\DeclareOption*{&lt;code&gt;}</code> .

*Note:* there should be no use of  
`\RequirePackage`, `\DeclareOption`, `\DeclareOption*` or `\ProcessOptions`  
inside `\DeclareOption` or `\DeclareOption*`.  
Possible uses for `\DeclareOption*` include:  
`\DeclareOption*{}`  
Do nothing. Silently accept unknown options. (This suppresses the usual warnings.)  
`\DeclareOption*{\@unknownoptionerror}`  
Complain about unknown local options. (The initial setting for package files.)  
`\DeclareOption*{\PassOptionsToPackage{\CurrentOption}{<pkg-name>}}`  
Handle the current option by passing it on to the package `<pkg-name>`, which will presumably be loaded via `\RequirePackage` later in the file. This is useful for building ‘extension’ packages, that perhaps handle a couple of new options, but then pass everything else on to an existing package.  
`\DeclareOption*{\InputIfFileExists{xx-\CurrentOption.yyy}%  
{}%  
{\OptionNotUsed}}`

Handle the option foo by loading the file `xx-foo.yyy` if it exists, otherwise do nothing, but declare that the option was not used. Actually the `\OptionNotUsed` declaration is only needed if this is being used in class files, but does no harm in package files.

### 3.5 Safe Input Macros

<code>\InputIfFileExists</code>	<code>\InputIfFileExists{&lt;file&gt;}{&lt;then&gt;}{&lt;else&gt;}</code> Inputs <code>&lt;file&gt;</code> if it exists. Immediately before the input, <code>&lt;then&gt;</code> is executed. Otherwise <code>&lt;else&gt;</code> is executed.
<code>\IfFileExists</code>	As above, but does not input the file. One thing you might like to put in the <code>&lt;else&gt;</code> clause is
<code>\@missingfileerror</code>	This starts an interactive request for a filename, supplying default extensions. Just hitting return causes the whole input to be skipped and entering <code>x</code> quits the current run,
<code>\input</code>	This has been redefined from the L <sup>A</sup> T <sub>E</sub> X 2.09 definition, in terms of the new commands <code>\InputIfFileExists</code> and <code>\@missingfileerror</code> .
<code>\listfiles</code>	Giving this declaration in the preamble causes a list of all files input via the ‘safe input’ commands to be listed at the end. Any strings specified in the optional argument to <code>\ProvidesPackage</code> are listed alongside the file name. So files in standard (and other non-standard) distributions can put informative strings in this argument.

## 4 Implementation

1 `<*2kernel>`

`\if@compatibility` The flag for compatibility mode.

2 `\newif\if@compatibility`

(End of definition for `\if@compatibility`.)

`\@documentclasshook` This legacy hook is called after the first `\documentclass` command. It is *not* integrated with the new 2020 hook management system! By default this checks to see if `\@normalsize` is undefined, and if so, sets it to `\normalsize`.

```

3 \def\@documentclasshook{%
4   \ifx\@normalsize\undefined
5     \let\@normalsize\normalsize
6   \fi
7 }

```

(End of definition for `\@documentclasshook`.)

`\@declaredoptions` This list is automatically built by `\DeclareOption`. It is the list of options (separated by commas) declared in the class or package file and it defines the order in which the corresponding `\ds<option>` commands are executed. All local `<option>`s which are not declared will be processed in the order defined by the optional argument of `\documentclass` or `\usepackage`.

```

8 \let\@declaredoptions\@empty

```

(End of definition for `\@declaredoptions`.)

`\@classoptionslist` List of options of the main class.

```

9 \let\@classoptionslist\relax
10 %\@onlypreamble\@classoptionslist

```

(End of definition for `\@classoptionslist`.)

`\@raw@classoptionslist` List of options of the main class (unprocessed).

```

11 \let\@raw@classoptionslist\relax

```

(End of definition for `\@raw@classoptionslist`.)

`\@unusedoptionlist` List of options of the main class that haven't been declared or loaded as class option files.

```

12 \let\@unusedoptionlist\@empty
13 %\@onlypreamble\@unusedoptionlist

```

(End of definition for `\@unusedoptionlist`.)

`\CurrentOption` Name of current package or option.

```

14 \let\CurrentOption\@empty

```

(End of definition for `\CurrentOption`.)

`\@currpath` Path to the current file if explicitly given.

```

15 </2ekernel>
16 <*2ekernel | latexrelease>
17 <latexrelease>
18 <latexrelease>\IncludeInRelease{2020/10/01}{\@currpath}%
19 <latexrelease> {Add \@currpath}%
20 \let\@currpath\@empty
21 <latexrelease>\EndIncludeInRelease
22 %
23 <latexrelease>\IncludeInRelease{0000/00/00}{\@currpath}%
24 <latexrelease> {Add \@currpath}%
25 <latexrelease>\let\@currpath\@undefined

```

```

26 <latexrelease>\EndIncludeInRelease
27 </2ekernel | latexrelease>
28 <*2ekernel>

```

(End of definition for \@currpath.)

**\@currname** Name of current package or option.

```

29 \let\@currname\@empty

```

(End of definition for \@currname.)

**\@currentt** The current file extension.

```

30 \global\let\@currentt=\@empty

```

(End of definition for \@currentt.)

**\@clsextension** The two possible values of \@currentt.

```

\@pkgextension
31 \def\@clsextension{cls}
32 \def\@pkgextension{sty}

```

(End of definition for \@clsextension and \@pkgextension.)

**\@pushfilename** Commands to push and pop the file name and extension.

**\@popfilename** #1 current name.

**\@currnamestack** #2 current extension.

#3 current catcode of @.

#4 Rest of the stack.

```

33 </2ekernel>
34 <*2ekernel | latexrelease>
35 <latexrelease>
36 <latexrelease>\IncludeInRelease{2020/10/01}{\@pushfilename}%
37 <latexrelease> {Add \@expl@push@filename@@ and \@expl@push@filename@aux@@}%
38 \def\@pushfilename{%

```

The push and pop macros are injected in \@pushfilename and \@popfilename so that they correctly keep track of the hook labels.

This needs cleanup with the expl3 interfaces also playing here, e.g., \@expl@push@filename@@ needs cleanup and (and should probably not have this name either).

```

39 \@expl@push@filename@@
40 \xdef\@currnamestack{%
41   {\@currname}%
42   {\@currentt}%
43   {\the\catcode'\@}%
44   \@currnamestack}%

```

Temporarily add a stack for \@currpath here. This should be integrated in the main file stack eventually, but other packages rely on \@currnamestack having three elements per file, so that isn't a trivial change. The prefix \@kernel@... hopefully discourages people from using it.

```

45 \xdef\@kernel@currpathstack{%
46   {\@currpath}%
47   \@kernel@currpathstack}%
48 \@expl@push@filename@aux@@
49 <latexrelease>\EndIncludeInRelease

```

The following version of `\@pushfilename` didn't formally exist in this file, but in the 2020/02/02 release, `expl3` was preloaded and it patched `\@pushfilename` (and `\@popfilename`) by adding some hooks in there. But rolling back to 2020/02/02, `expl3` doesn't patch these macros again, so rolling back has to take those hooks into account. Same goes for `\@popfilename`.

```

50 <latexrelease>
51 <latexrelease>\IncludeInRelease{2020/02/02}{\@pushfilename}%
52 <latexrelease> {Add \@expl@push@filename@@}%
53 <latexrelease>\def\@pushfilename{%
54 <latexrelease> \@expl@push@filename@@
55 <latexrelease> \xdef\@currnamestack{%
56 <latexrelease> {\@currname}%
57 <latexrelease> {\@current}%
58 <latexrelease> {\the\catcode'\@}%
59 <latexrelease> \@currnamestack}%
60 <latexrelease> \@expl@push@filename@aux@@}
61 <latexrelease>\EndIncludeInRelease
62 <latexrelease>

```

When we roll back from a release that has `expl3` preloaded, the definitions of `\@pushfilename` and `\@popfilename` can't be completely rolled back otherwise `expl3`-based packages won't have the automatic `\ExplSyntaxOff` at the end. Here and below for `\@popfilename`, we don't roll back all the way through if coming from `LATEX > 2020-02-02`.

```

*(End of definition for \@pushfilename, \@popfilename, and \@currnamestack.)*

**\@kernel@currpathstack** Path to the current file if explicitly given. The auxiliary is needed here to insert a \@empty to prevent the loss of braces.

```

123 </2ekernel>
124 <*2ekernel | latexrelease>
125 <latexrelease>
126 <latexrelease>\IncludeInRelease{2020/10/01}{\@kernel@currpathstack}%
127 <latexrelease> {Add \@kernel@currpathstack}%

```

If rolling backwards to this release, \@kernel@currpathstack will be defined, so the \gdef line should not be executed, thus the \@gobblethree will take it out, so the satch isn't touched.

```

128 <latexrelease>\@ifundefined{kernel@currpathstack}{\@gobblethree}
129 \gdef\@kernel@currpathstack{}%

```

If rolling forward to this release, then the \gdef line above will define the path stack to be empty (which it can't be, inside a file), so the code below will traverse the \@currnamestack, and add as many empty items to \@kernel@currpathstack as there

are items in `\@currnamestack`, so both are back in sync. Most of the time `latexrelease` is loaded on top-level, so only one item is needed, but `platexrelease` loads it internally, so the more complicated loop is needed.

`\ProvidesClass` Like `\ProvidesPackage`, but for classes. This needs a dummy `latexrelease` block to copy the definition of `\ProvidesPackage` as it changes across releases.

```

421 </2ekernel>
422 <latexrelease>\IncludeInRelease{0000/00/00}%
423 <latexrelease>  {\ProvidesClass}{Track \ProvidesPackage}%
424 <*2ekernel | latexrelease>
425 \let\ProvidesClass\ProvidesPackage
426 \@onlypreamble\ProvidesClass
427 </2ekernel | latexrelease>
428 <latexrelease>\EndIncludeInRelease
429 <*2ekernel>

```

(End of definition for `\ProvidesClass`.)

`\ProvidesFile` Like `\ProvidesPackage`, but for arbitrary files. Do not apply `\@onlypreamble` to these, as we may want to label files input during the document.

```
\@providesfile 430 \def\ProvidesFile#1{%
431   \begingroup
432   \catcode'\ 10 %
433   \ifnum \endlinechar<256 %
434     \ifnum \endlinechar>\m@ne
435       \catcode\endlinechar 10 %
436     \fi
437   \fi
438   \@makeother\/%
439   \@makeother\&%
440   \kernel@ifnextchar[{\@providesfile{#1}}{\@providesfile{#1}[]}]}
```

During initex a special version of `\@providesfile` is used. The real definition is installed right at the end, in `ltfinal.dtx`.

```
def\@providesfile#1[#2]{%
  \wlog{File: #1 #2}%
  \expandafter\xdef\csname ver@#1\endcsname{#2}%
  \endgroup}
```

*(End of definition for \ProvidesFile and \@providesfile.)*

`\PassOptionsToPackage` If the package has been loaded, we check that it was first loaded with the options.  
`\PassOptionsToClass` Otherwise we add the option list to that of the package.

```
441 </2ekernel>

```

Then we do some work.

First of all, we define the global variables. Then we look to see if the file has already been loaded. If it has, we check that it was first loaded with at least the current options. If it has not, we add the current options to the package options, set the default version to be 0000/00/00, and load the file if we can find it. Then we check the version number.

Finally, we restore the old file name, reset the default option, and we set the catcode of `@`.

For classes, we can immediately process the file. For other types, `#2` could be a comma separated list, so loop through, processing each one separately.

```

899 \@onlypreamble\@fileswith@pti@ns

```

This macro is used when loading packages or classes.

`\load@onefilewithoptions` Have the main argument as #1, so we only need one `\expandafter` above.

```

900 </2ekernel>
901 <*2ekernel | latexrelease>
902 <latexrelease>\IncludeInRelease{2020/10/01}%
903 <latexrelease> {\@onefilewithoptions}{Hooks and unused options issue}%

```

Here this macro is called `\@onefilewithoptions`, but further ahead in this file it is renamed to `\load@onefilewithoptions`, and `\@onefilewithoptions` becomes a wrapper around this, used for bookkeeping when rolling back. Therefore, when in `latexrelease`, we need to define `\load@onefilewithoptions` instead, thus the extra guarded `\def` line below:

```

904 <*2ekernel>
905 \def\@onefilewithoptions#1[#2][#3]#4{%
906 </2ekernel>
907 <latexrelease>\def\load@onefilewithoptions#1[#2][#3]#4{%

```

We have to sanitise file names, so that something like

```

\usepackage{some/local/path/array}
\usepackage{array}

```

won't load `array.sty` twice. It is remotely possible that those are two different files, but as a matter of principles, we will consider that the base file name uniquely identifies a package, regardless of where it lives. This assumption already holds for file hooks, for example, which address the hook to a file by its base name only.

We'll use `\@expl@@@filehook@set@curr@file@@nNN{#1.#4}\reserved@a\reserved@b` to parse the file name and return the `<path>` and `<base+ext>` in separate token lists. Further ahead, most operations use `\@currname` which doesn't have a path attached to it; only few actions prepend `\@currpath` to `\@currname` (namely loading, as we have to respect the given path).

A file substitution isn't followed just yet because at this point we are parsing user input, so the file is still what the user asked for, and not the file actually loaded.

```

908 \@expl@@@filehook@set@curr@file@@nNN{#1.#4}\reserved@a\reserved@b
909 \edef\reserved@c{\def\noexpand\reserved@c####1%
910 \detokenize\expandafter{\expanded{.#4}}}%
911 \noexpand\@nil{\def\noexpand\reserved@a{####1}}}\reserved@c
912 \expandafter\reserved@c\reserved@a\@nil
913 \@pushfilename
914 \xdef\@currname{\string@makeletter\reserved@a}%
915 \xdef\@currpath{\ifx\reserved@b\@empty\else\reserved@b\fi}%
916 \global\let\@currentx#4%

```

The command `\ver@<file>.<ext>` is used to signal that a package is already loaded, either because it is in fact loaded, or because its loading was suppressed. In minimal installations, said package may not exist but still have its loading suppressed with `\ver@<file>.<ext>`, so before checking if the file exists we have to check that we do need to load it with `\@ifl@aded`. If we don't, then there's no point in checking for a typo or load-disabling.

```

917 \@ifl@aded\@currentx\@currname

```

In the current preferred approach, a key family name will exist for processing using `ltkeys`. In that case, we replace the previous package options with the new ones, then call the key handler. Otherwise, we use the more classical clash handler.

```

918 {%
919 \@ifundefined{opt@handler@\@currname.\@currentx}
920 {\@onefilewithoptions@clashchk{#2}}
921 {%
922 \expandafter\protected@edef
923 \csname opt@\@currname.\@currentx\endcsname
924 {\zap@space#2 \@empty}%
925 \expandafter\def
926 \csname @raw@opt@\@currname.\@currentx\expandafter\endcsname
927 \expandafter{#2}%
928 \@nameuse{opt@handler@\@currname.\@currentx}%
929 }%
930 }%
931 {\makeatletter

```

The next line seems to be necessary for 2.09 compatibility (the way the code is written there) This seems questionable and should be look at as in 2e it is definitely unnecessary at this point!

```

932 \@reset@ptions

```

First we take the  $\langle name \rangle$  and  $\langle ext \rangle$  given in the argument and check if the file exists, and issue an error otherwise asking for a correction with  $\backslash@missingfileerror$ . For checking if the file exists we use  $\backslash@currpath$  (usually empty) before  $\backslash@currname$ .

```
933 \IfFileExists{\@currpath\@currname.\@currentext}{}%
934 {\@missingonefilewithoptions{#2}}%
```

If  $\backslash@currname$  is empty (the user replied to the “Enter file name” prompt with  $\langle RETURN \rangle$ ), so stop here (do  $\backslash@popfilename$  to pop the item just added above).

This  $\backslash@gobble$  omits the date check at the end.

```
935 \ifx\@currname\empty
936 \expandafter\@gobble
937 \else
```

If the file exists, check if it was load-prevented, and otherwise do the bookkeeping with  $\backslash@filehook@file@push$  then call  $\backslash@set@curr@file$  to set  $\backslash@curr@file$  (and do any required substitution), then actually load the class/package with  $\backslash@load@onefile@withoptions$ .  $\backslash@set@curr@file$  also needs the file path.

```
938 \@disable@packageload@do{\@currname.\@currentext}%
939 {\@expl@@@filehook@file@push@@
940 \set@curr@file{\@currpath\@currname.\@currentext}%
941 \@filehook@set@CurrentFile
```

The  $\backslash@set@curr@file$  line above might have replaced the file, so  $\backslash@currname$  and  $\backslash@currentext$  may no longer hold the actual package being loaded, so in that case we need to update these two token lists ( $\backslash@curr@file$  holds the file name after replacement, so we parse that).

The requested file is saved in  $\backslash@currpkg@reqd$  to be used in  $\backslash@InputIfFileExists$  later: if the updated  $\backslash@currname$  and  $\backslash@currentext$  are used we lose track of the substitution, so  $\backslash@CurrentFile$  and  $\backslash@CurrentFileUsed$  will be (incorrectly) the same.

```
942 \expandafter\@swaptwoargs\expandafter
943 {\expandafter{\@currpkg@reqd}}%
944 {% <
```

$\backslash@currpkg@reqd$  doesn’t take a path because it is used later to assign  $\backslash@opt@...$  and  $\backslash@ver@...$

```
945 \edef\@currpkg@reqd{\@currname.\@currentext}%
946 \ifx\CurrentFile\CurrentFileUsed
947 \else
948 \filename@parse\@curr@file
949 \edef\@currpath{\string@makeletter\filename@area}%
950 \edef\@currname{\string@makeletter\filename@base}%
951 \edef\@currentext{\string@makeletter\filename@ext}%
952 \fi
953 \load@onefile@withoptions{#2}%
954 \def\@currpkg@reqd%\@currpkg@reqd%
955 }% >
```

Now just clean up and exit.

```
956 \@expl@@@filehook@file@pop@@}%
957 \expandafter\@firstofone
958 \fi}%
```

Except in the case where \@currname is empty, the date is checked against the date marked in the package file:

```

959 {\ifl@ter\@currentx{\@currname}{#3}{}%
960 {\@latex@warning@no@line
961 {You have requested,\on@line,
962 version\MessageBreak
963 '#3' of \@cls@pkg\space \@currname,\MessageBreak
964 but only version\MessageBreak
965 '\csname ver@\@currname.\@currentx\endcsname'\MessageBreak
966 is available}}}%

967 \ifx\@currentx\@clsextension\let\LoadClass\@twoloadclasserror\fi}%
968 \@popfilename
969 \@reset@options}

```

If the package is already loaded, check that there were no option clashes.

```

\@onefilewithoptions@clashchk
970 \def\@onefilewithoptions@clashchk#1{%
971 \if@options\@currentx{\@currname}{#1}{}%
972 {\@latex@error
973 {Option clash for \@cls@pkg\space \@currname}%
974 {The package \@currname\space has already been loaded
975 with options:\MessageBreak
976 \space\space[\@optionlist{\@currname.\@currentx}]\MessageBreak
977 There has now been an attempt to load it
978 with options\MessageBreak

980 Adding the global options:\MessageBreak
981 \space\space
982 \@optionlist{\@currname.\@currentx},#1\MessageBreak
983 to your \noexpand\documentclass declaration may fix this.%
984 \MessageBreak
985 Try typing \space <return> \space to proceed.}}%
986 \@firstofone}

987 \let\@currpkg@reqd\@empty
988 \@onlypreamble\@onefilewithoptions
989 \let\@unprocessedoptions\@undefined

```

Now the action taken when a file is not found. Path must be included here as it eventually leads to a file lookup.

```

990 \def\@missing@onefilewithoptions#1{%
991 \@missingfileerror{\@currpath\@currname}\@currentx
992 \global\let\@currpath\@missingfile@area
993 \global\let\@currname\@missingfile@base
994 \global\let\@currentx\@missingfile@ext}

```

Now the code that actually does the file loading:

```

\load@onefile@withoptions
995 \def\load@onefile@withoptions#1{%
996 \let\CurrentOption\@empty
997 \@reset@options

```

Grab everything in a macro, so the parameter stack is popped before any processing begins.

```

998 \def\reserved@a{%
999 \pass@options\@currentx{#1}\@currname}%

1000 \expandafter\let
1001 \csname opt@\@currpkg@reqd\expandafter\endcsname
1002 \csname opt@\@currname.\@currentx\endcsname
1003 \expandafter\let
1004 \csname @raw@opt@\@currpkg@reqd\expandafter\endcsname
1005 \csname @raw@opt@\@currname.\@currentx\endcsname
1006 \global\expandafter
1007 \let\csname ver@\@currname.\@currentx\endcsname\@empty

```

We initialize `\...-h@@k` here and only if we load the file so that it remains undefined otherwise.

```

1008 \expandafter\let\csname\@currname.\@currentx-h@@k\endcsname\@empty

```

When the current extension is `\@pkgextension` we are loading a package otherwise, if it is `\@clsextension`, a class, so depending on that we execute different hooks. If the extension is neither, then it is another type of file without special hooks.

```

1009 %-----
1010 \ifx\@currentx\@pkgextension
1011 \UseHook{package/before}%
1012 \UseOneTimeHook{package/\@currname/before}%
1013 \else
1014 \ifx\@currentx\@clsextension
1015 \UseHook{class/before}%
1016 \UseOneTimeHook{class/\@currname/before}%
1017 \fi
1018 \fi

```

Now actually load the file (at this point we are certain it exists, but use `\InputIfFileExists` so that file hooks are executed). `\@currpath` is needed here too.

```

1019 \InputIfFileExists{\@currpath\@currpkg@reqd}{}%
1020 {\@latex@error
1021 {The \@cls@pkg\space\@currpkg@reqd\space failed to load}\@ehd}%
1022 %-----

```

In older versions of the code `\@unprocessedoptions` would generate an error for each specified option in a package unless a `\ProcessOptions` has appeared in the package file.

This has changed in 2020. We now use a separate macro per package to avoid interference in case of nested packages. The whole code for handling this issue (GitHub 22) was provided by Hironobu Yamashita, thanks for that.

```

1023 \expandafter\let\csname unprocessedoptions-\@currname.\@currentx\endcsname
1024 \@@unprocessedoptions
1025 \csname\@currname.\@currentx-h@@k\endcsname
1026 \expandafter\let\csname\@currname.\@currentx-h@@k\endcsname
1027 \undefined

```

Catch the case where the packages has handled the options and redefined `\@unprocessedoptions` to `\relax` (old interface). In that case no error should be produced.

```

1028 \ifx\@unprocessedoptions\relax
1029 \let\@unprocessedoptions\undefined

```

Otherwise run the per package set of unused options.

```

1030 \else
1031 \csname unprocessedoptions-\@currname.\@current\endcsname
1032 \fi

```

In either case we drop the macro afterwards as it is no longer needed.

```

1033 \expandafter\let
1034 \csname unprocessedoptions-\@currname.\@current\endcsname
1035 \@undefined

```

And same procedure, James, when we are finished loading, except that the hook order is now reversed.

```

1036 %-----
1037 \ifx\@current\@pkgextension
1038 \UseOneTimeHook{package/\@currname/after}%
1039 \UseHook{package/after}%
1040 \else
1041 \ifx\@current\@clsextension
1042 \UseOneTimeHook{class/\@currname/after}%
1043 \UseHook{class/after}%
1044 \fi
1045 \fi}%
1046 %-----
1047 \@ifl@aded\@current\@currname{}\reserved@a{}

```

Now declare the non-generic package and class hooks used above:

```

1048 \NewHook{package/before}
1049 \NewHook{class/before}
1050 \NewReversedHook{package/after}
1051 \NewReversedHook{class/after}

1052 </2ekernel | latexrelease>
1053 <latexrelease>\EndIncludeInRelease
1054 <latexrelease>\IncludeInRelease{0000/00/00}%
1055 <latexrelease> \{\@onefilewithoptions\}{Hooks and unused options issue}%
1056 <latexrelease>

```

Because of the way \@onfilewithoptions is changed for rollback handling below we have to define \load@onefilewithoptions when rolling back!

```

1057 <latexrelease>\def\load@onefilewithoptions#1[#2][#3]#4{%
1058 <latexrelease> \@pushfilename
1059 <latexrelease> \xdef\@currname{#1}%

## 4.1 Hooks

Allow code to be saved to be executed at specific later times.

Here we save things in macros. I considered using toks registers (and \addto@hook from the NFSS code), but that would require stacking the contents in the case of required packages, so just generate a new macro for each package.

\@begindocumenthook Stuff to appear at the beginning or end of the document.

```

\@enddocumenthook
1123 \ifx\@begindocumenthook\undefined
1124 \let\@begindocumenthook\empty
1125 \fi
1126 \let\@enddocumenthook\empty

```

(End of definition for \@begindocumenthook and \@enddocumenthook.)

\AtEndOfPackage The access functions.

```

\AtEndOfClass
\AtBeginDocument
\AtEndDocument
1127 \def\AtEndOfPackage{%
1128 \expandafter\g@addto@macro\csname\@currname.\@current-h@@k\endcsname}
1129 \let\AtEndOfClass\AtEndOfPackage
1130 \@onlypreamble\AtEndOfPackage
1131 \@onlypreamble\AtEndOfClass
1132 \</2ekernel>
1133 \<*2ekernel | latexrelease>
1134 \<latexrelease>\IncludeInRelease{2020/10/01}%
1135 \<latexrelease> \{\AtBeginDocument\}{Use hook system}%
1136 \DeclareRobustCommand\AtBeginDocument{\AddToHook{begindocument}}
1137 \DeclareRobustCommand\AtEndDocument {\AddToHook{enddocument}}
1138 %\DeclareRobustCommand\AtEndDocument {\AddToHook{env/document/end}} % alternative impl
1139 \</2ekernel | latexrelease>
1140 \<latexrelease>\EndIncludeInRelease
1141 \<latexrelease>\IncludeInRelease{0000/00/00}%
1142 \<latexrelease> \{\AtBeginDocument\}{Use hook system}%
1143 \<latexrelease>
1144 \<latexrelease>\DeclareRobustCommand\AtBeginDocument{\g@addto@macro\@begindocumenthook}
1145 \<latexrelease>\DeclareRobustCommand\AtEndDocument{\g@addto@macro\@enddocumenthook}
1146 \<latexrelease>
1147 \<latexrelease>\EndIncludeInRelease
1148 \<*2ekernel>

```

In its initial implementation (not using the hook system) \AtBeginDocument was made \@onlypreamble because using it later had no effect whatsoever, thus was most certainly an unintended programming error. With the reimplementaion, using the begindocument hook internally, this has changed because adding to a onetime hook after it has already been used simply executes the additional code immediately. We therefore no longer generate an error if it is used inside the document so that \AddToHook{begindocument} and \AtBeginDocument are truly equivalent (as claimed in the hook documentation).

```

## 5 Package/class rollback mechanism

```

1594 </2ekernel>
1595 <*2ekernel | latexreleasefirst>

```

\pkgcls@debug For testing we have a few extra lines of code that by default do nothing but one can set \pkgcls@debug to \typeout to get extra info. Sometime in the future this will be dropped.

```

1596 <*tracerollback>

```

```

1597 %\let\pkgcls@debug\typeout
1598 \let\pkgcls@debug@gobble
1599 </tracerollback>

```

*(End of definition for \pkgcls@debug.)*

**\requestedLaTeXdate** The macro (!) **\requestedLaTeXdate** holds the globally requested rollback date (via **latexrelease**) or zero if no such request was made.

```

1600 \def\requestedLaTeXdate{0}

```

*(End of definition for \requestedLaTeXdate.)*

**\pkgcls@targetdate** If a rollback for a package or class is requested then **\pkgcls@targetdate** holds the requested date as a number YYYYMMDD (if there was one, otherwise the value of **\requestedLaTeXdate**) and **\pkgcls@targetlabel** will be empty. If there was a request for a named version then **\pkgcls@targetlabel** holds the version name and **\pkgcls@targetdate** is set to 1.

**\pkgcls@targetdate=0** is used to indicate that there was no rollback request. While loading an old release **\pkgcls@targetdate** is also reset to zero so that **\DeclareRelease** declarations are bypassed.

In contrast **\pkgcls@innerdate** will always hold the requested date (in a macro not a counter) if there was one, otherwise, e.g., if there was no request or a request to a version name it will contain T<sub>E</sub>X largest legal number. While loading a file this can be used to provide conditionals that select code based on the request.

```

1601 \ifx\pkgcls@targetdate\@undefined
1602   \newcount\pkgcls@targetdate
1603   \fi
1604 \let\pkgcls@targetlabel\@empty
1605 \def\pkgcls@innerdate{\maxdimen}

```

*(End of definition for \pkgcls@targetdate, \pkgcls@targetlabel, and \pkgcls@innerdate.)*

**\pkgcls@candidate** When looping through the **\DeclareRelease** declarations we record if the release is the best candidate we have seen so far. This is recorded in **\pkgcls@candidate** and we update it whenever we see a better one.

In **\pkgcls@releasedate** we keep track of the release date of that candidate.

```

1606 \let\pkgcls@candidate\@empty
1607 \let\pkgcls@releasedate\@empty

```

*(End of definition for \pkgcls@candidate and \pkgcls@releasedate.)*

**\load@onefilewithoptions** the best place to add the rollback code is at the point where **\@onefilewithoptions** is called to load a single class or package.

To make things easy we save the old definition as **\load@onefilewithoptions** and then provide a new interface.

Important: as this code is also unconditionally placed into **latexrelease** we can only do this name change once otherwise both macros will contain the same code.

```

1608 \ifx\load@onefilewithoptions\@undefined
1609   \let\load@onefilewithoptions\@onefilewithoptions
1610   \def\@onefilewithoptions#1[#2][#3]#4{%

```

First a bit of tracing normally disabled.

```

1611 <*tracerollback>
1612 \pkgcls@debug{--- File loaded request (\noexpand\usepackage or ...)}%
1613 \pkgcls@debug{\@spaces 1: #1}%
1614 \pkgcls@debug{\@spaces 2: #2}%
1615 \pkgcls@debug{\@spaces 3: #3}%
1616 \pkgcls@debug{\@spaces 4: #4}%
1617 </tracerollback>

```

Three of the arguments are needed later on in error/warning messages so we save them.

```

1618 \def\pkgcls@name{#1}% % for info message
1619 \def\pkgcls@arg {#3}% % for info message
1620 \edef\pkgcls@ext{%
1621 \ifx#4\@clsextension document class\else
1622 \ifx#4\@pkgextension package\else
1623 file
1624 \fi
1625 \fi
1626 }% % for info message

```

then we parse the final optional argument to determine if there is a specific rollback request for the current file. This will set `\pkgcls@targetdate`, `\pkgcls@targetlabel` and `\pkgcls@mindate`.

```

1627 \pkgcls@parse@date@arg{#3}%

```

When determining the correct release to load we keep track of candidates in `\pkgcls@candidate` and initially we don't have any:

```

1628 \let\pkgcls@candidate\@empty

```

If we had a rollback request then #3 may contain data but not necessarily a “minimal date” so instead of passing it on we pass on the content of `\pkgcls@mindate`. We need to pass the value not the command, otherwise nested packages may pick up the wrong information.

```

1629 \begingroup
1630 \edef\reserved@a{%
1631 \endgroup
1632 \unexpanded{\load@onefilewithoptions#1[#2]}%
1633 [\pkgcls@mindate]%
1634 \unexpanded{#4}}%
1635 \reserved@a
1636 }
1637 \fi

```

*(End of definition for \load@onefilewithoptions and \@onefilewithoptions.)*

`\pkgcls@parse@date@arg` The `\pkgcls@parse@date@arg` command parses the second optional argument of `\usepackage`, `\RequirePackage` or `\documentclass` for a rollback request setting the values of `\pkgcls@targetdate` and `\pkgcls@targetlabel`.

This optional argument has a dual purpose: If it just contains a date string then this means that the package should have at least that date (to ensure that a certain feature is actually available, or a certain bug has been fixed). When the package gets loaded the information in `\Provides...` will then be checked against this request.

But if it starts with an equal sign followed by a date string or followed by a version name then this means that we should roll back to the state of the package at that date or to the version with the requested name.

If there was no optional argument or the optional argument does not start with “=” then the `\pkgcls@targetdate` is set to the date of the overall rollback request (via `latexrelease`) or if that was not given it is set to 0. In either case `\pkgcls@targetlabel` will be made empty.

If the argument doesn’t start with “=” then it is supposed to be a “minimal date” and we therefore save the value in `\pkgcls@mindate`, otherwise this macro is made empty.

So in summary we have:

Input	<code>\pkgcls@targetdate</code>	<code>\pkgcls@targetlabel</code>	<code>\pkgcls@mindate</code>
<code>&lt;empty&gt;</code>	→ <code>&lt;global-rollbackdate-as-number&gt;</code>	<code>&lt;empty&gt;</code>	<code>&lt;empty&gt;</code>
<code>&lt;date&gt;</code>	→ <code>&lt;global-rollbackdate-as-number&gt;</code>	<code>&lt;empty&gt;</code>	<code>&lt;date&gt;</code>
<code>=&lt;date&gt;</code>	→ <code>&lt;date-as-number&gt;</code>	<code>&lt;empty&gt;</code>	<code>&lt;empty&gt;</code>
<code>=&lt;version&gt;</code>	→ 1	<code>&lt;version&gt;</code>	<code>&lt;empty&gt;</code>
<code>&lt;other&gt;</code>	→ <code>&lt;global-rollbackdate-as-number&gt;</code>	<code>&lt;empty&gt;</code>	<code>&lt;other&gt;</code>

where `<global-rollbackdate-as-number>` is a date request given via `latexrelease` or if there wasn’t one 0.

```
1638 \def\pkgcls@parse@date@arg #1{%
```

If the argument is empty we use the rollback date from `latexrelease` which has the value of zero if there was no rollback request. The label and the minimal date is made empty in that case.

```
1639 \ifx\@nil#1\@nil
1640 \pkgcls@targetdate\requestedLaTeXdate\relax
1641 \let\pkgcls@targetlabel\@empty
1642 \let\pkgcls@mindate\@empty
```

Otherwise we parse the argument further, checking for a = as the first character. We append a = at the end so that there is at least one such character in the argument.

```
1643 \else
1644 \pkgcls@parse@date@arg@#1=\@nil\relax
1645 \fi
1646 }
```

The actual parsing work then happens in `\pkgcls@parse@date@arg@`:

```
1647 \def\pkgcls@parse@date@arg@#1=#2\@nil{%
```

We set `\pkgcls@targetdate` depending on the parsing result; the code is expandable so we can do the parsing as part of the assignment.

```
1648 \pkgcls@targetdate
```

If a = was in first position then #1 will be empty. In that case #2 will be the original argument with a = appended.

This can be parsed with `\@parse@version`, the trailing character is simply ignored. This macro returns the parsed date as a number (or zero if it wasn’t a date) and accepts both YYYY/MM/DD and YYYY-MM-DD formats.

```
1649 \ifx\@nil#1\@nil
1650 \@parse@version0#2//00\@nil\relax
```

Whatever is returned is thus assigned to `\pkgcls@targetdate` and therefore we can now test its value. If the value is zero we assume that the remaining argument string represents a version and change `\pkgcls@targetdate` and set `\pkgcls@targetlabel` to the version name (after stripping off the trailing =).

```
1651 \ifnum \pkgcls@targetdate=\z@
```

```

1652     \pkgcls@targetdate\@ne
1653     \def\pkgcls@innerdate{\maxdimen}%
1654     \pkgcls@parse@date@arg@version#2%
1655     \else
1656     \edef\pkgcls@innerdate{\the\pkgcls@targetdate}%
1657     \fi
1658     \let\pkgcls@mindate\@empty
1659     \else

```

If #1 was not empty then there wasn't a = character in first position so we are dealing either with a “minimum date” or with some incorrect data. We assume the former and make the following assignments (the first one finishing the assignment of \pkgcls@targetdate):

```

1660     \requestedLaTeXdate\relax
1661     \let\pkgcls@targetlabel\@empty
1662     \def\pkgcls@innerdate{\maxdimen}%
1663     \def\pkgcls@mindate{#1}%

```

If the min-date is after the requested rollback date (if there is any, i.e., if it is not zero) then we have a conflict and therefore issue a warning.

```

1664     \ifnum \pkgcls@targetdate > \z@
1665     \ifnum \@parse@version0#1//00\@nil > \pkgcls@targetdate
1666     \@latex@warning@no@line{Suspicious rollback/min-date date given\MessageBreak
1667     A minimal date of #1 has been specified for
1668     \pkgcls@ext\MessageBreak '\pkgcls@name'.\MessageBreak
1669     But this is in conflict
1670     with a rollback request to \requestedpatchdate}
1671     \fi
1672     \fi
1673     \fi
1674 }

```

Strip off the trailing = and assign the version name to \pkgcls@targetlabel.

```

1675 \def\pkgcls@parse@date@arg@version#1={%
1676   \def\pkgcls@targetlabel{#1}}

```

(End of definition for \pkgcls@parse@date@arg.)

**\DeclareRelease** First argument is the “name” of the release and it can be left empty if one doesn't like to give a name to the release. The second argument is that from which on this release was available (or should be used in case of minor updates). The final argument is the external file name of this release, by convention this should be `<pkg/cls-name>-<date>.<extension>` but this is not enforced and through this argument one can overwrite it.

```

1677 \def\DeclareRelease#1#2#3{%
1678   \ifnum\pkgcls@targetdate>\z@ % some sort of rollback request
1679   <*tracerollback>
1680     \pkgcls@debug{---\string\DeclareRelease:}%
1681     \pkgcls@debug{\@spaces 1: #1}%
1682     \pkgcls@debug{\@spaces 2: #2}%
1683     \pkgcls@debug{\@spaces 3: #3}%
1684   </tracerollback>

```

If the date argument #2 is empty we are dealing with a special release that should be only accessible via its name; a typical use case would be a “beta” release. So if we are currently processing a date request we ignore it and otherwise we check if we can match the name and if so load the corresponding release file.

```

1685 \ifx\@nil#2\@nil
1686 \ifnum\pkgcls@targetdate=\@ne % named request
1687 \def\reserved@a{#1}%
1688 \ifx\pkgcls@targetlabel\reserved@a
1689 \pkgcls@use@this@release{#3}{}%
1690 (*tracereollback)
1691 \else
1692 \pkgcls@debug{Label doesn't match}%
1693 (/tracereollback)
1694 \fi
1695 (*tracereollback)
1696 \else
1697 \pkgcls@debug{Date request: ignored}%
1698 (/tracereollback)
1699 \fi
1700 \else

```

If the value of \pkgcls@targetdate is greater than 1 (or in reality greater than something like 19930101) we are dealing with a rollback request to a specific date.

```

1701 \ifnum\pkgcls@targetdate>\@ne % a real request

```

So we parse the date of this release to check if it is before or after the request date.

```

1702 \ifnum\@parse@version#2//00\@nil
1703 >\pkgcls@targetdate

```

If it is after we have to distinguish between two cases: If there was an earlier candidate we use that one because the other is too late, but if there wasn't one (i.e., if current release is the oldest that exists) we use it as the best choice. However in that case something is wrong (as there shouldn't be a rollback to a date when a package used didn't yet exists). So we make a complained to the user.

```

1704 \ifx\pkgcls@candidate\@empty
1705 \pkgcls@rollbackdate@error{#2}%
1706 \pkgcls@use@this@release{#3}{#2}%
1707 \else
1708 \pkgcls@use@this@release\pkgcls@candidate
1709 \pkgcls@releasedate
1710 \fi
1711 \else

```

Otherwise, if the release date of this version is before the target rollback and we record it as a candidate. But we don't use it yet as there may be another release which is still before the target rollback.

```

1712 \def\pkgcls@candidate{#3}%
1713 \def\pkgcls@releasedate{#2}%
1714 (*tracereollback)
1715 \pkgcls@debug{New candidate: #3}%
1716 (/tracereollback)
1717 \fi
1718 \else

```

If we end up in this branch we have a named version request. So we check if `\pkgcls@targetlabel` matches the current name and if yes we use this release immediately, otherwise we do nothing as a later declaration may match it.

```

1719     \def\reserved@a{#1}%
1720     \ifx\pkgcls@targetlabel\reserved@a
1721         \pkgcls@use@this@release{#3}{#2}%
1722 \<traceroollback>
1723     \else
1724         \pkgcls@debug{Label doesn't match}%
1725 \</traceroollback>
1726     \fi
1727 \fi
1728 \fi
1729 \fi
1730 }
```

(End of definition for `\DeclareRelease`.)

`\pkgcls@use@this@release` If a certain release has been selected (stored in the external file given in #1) we need to input it and afterwards stop reading the current file.

```

1731 \def\pkgcls@use@this@release#1#2{%
```

Before that we record the selection made inside the transcript.

```

1732     \pkgcls@show@selection{#1}{#2}%
```

We then set the `\pkgcls@targetdate` to zero so that any `\DeclareRelease` or `\DeclareCurrentRelease` in the file we now load are bypassed<sup>52</sup> and then we finally load the correct release.

After loading that file we need to stop reading the current file so we issue `\endinput`. Note that the `\relax` before that is essential to ensure that the `\endinput` is only happening after the file has been fully processed, otherwise it would act after the first line of the `@@input`!

```

1733     \pkgcls@targetdate\z@
1734     \@addtofilelist{#1}%
1735     @@input #1\relax
1736     \endinput
1737 }
```

(End of definition for `\pkgcls@use@this@release`.)

`\pkgcls@show@selection` This command records what selection was made. As that is needed in two places (and it is rather lengthy) it was placed in a separate command. The first argument is the name of the external file that is being loaded and is only needed for debugging. The second argument is the date that corresponds to this file and it is used as part of the message.

```

1738 \def\pkgcls@show@selection#1#2{%
1739 \<traceroollback>
1740     \pkgcls@debug{Result: use #1}%
1741 \</traceroollback>
1742     \GenericInfo
1743     {\@spaces\@spaces\space}{Rollback for
1744     \@cls@pkg\space'\@currname' requested ->
```

<sup>52</sup>The older release may also have such declarations inside if it was a simply copy of the `.sty` or `.cls` file current at that date. Removing these declarations would make the file load a tiny bit faster, but this way it works in any case.

```

1745 \ifnum\pkgcls@targetdate>\@ne
1746     date
1747     \ifnum\requestedLaTeXdate=\pkgcls@targetdate
1748         \requestedpatchdate
1749     \else
1750         \expandafter\@gobble\pkgcls@arg
1751     \fi.\MessageBreak

```

Instead of “best approximation” we could say that we have been able to exactly match the date (if it is exact), but that would mean extra tests without much gain, so not done.

```

1752     Best approximation is
1753 \else
1754     version '\pkgcls@targetlabel'.\MessageBreak
1755     This corresponds to
1756 \fi
1757 \ifx\@nil#2\@nil
1758     a special release%
1759 \else
1760     the release introduced on #2%
1761 \fi
1762 \@gobble}%
1763 }

```

*(End of definition for \pkgcls@show@selection.)*

**\pkgcls@rollbackdate@error** This is called if the requested rollback date is earlier than the earliest known release of a package or class.

A similar error is given if global rollback date and min-date on a specific package conflict with each other, but that case is happens only once so it is inlined.

```

1764 \def\pkgcls@rollbackdate@error#1{%
1765     \@latex@error{Suspicious rollback date given}%
1766     {The \@cls@pkg\space'\@currname' has no rollback data
1767     before #1 which\MessageBreak
1768     is after your requested rollback date --- so
1769     something may be wrong here.\MessageBreak
1770     Continue and we use the earliest known release.}}

```

*(End of definition for \pkgcls@rollbackdate@error.)*

**\DeclareCurrentRelease** This declares the date (and possible name) of the current version of a package or class.

```

1771 \def\DeclareCurrentRelease#1#2{%

```

First we test if \pkgcls@targetdate is greater than zero, otherwise this code is bypassed (as there is no rollback request).

```

1772 \ifnum\pkgcls@targetdate>\z@ % some sort of rollback request
1773 {*tracerollback}
1774     \pkgcls@debug{---DeclareCurrentRelease}%
1775     \pkgcls@debug{ 1: #1}%
1776     \pkgcls@debug{ 2: #2}%
1777 \}
```

If the value is greater than 1 we have to deal with a date request, so we parse #2 as a date and compare it with \pkgcls@targetdate.

```

1778 \ifnum\pkgcls@targetdate>\@ne % a date request
1779     \ifnum\@parse@version#2//00\@nil
1780         >\pkgcls@targetdate

```

If it is greater that means the release date if this file is later than the requested rollback date. Again we have two cases: If there was a previous candidate release we use that one as the current release is too young, but if there wasn't we have to use this release nevertheless as there isn't any alternative.

However this case can only happen if there is a `\DeclareCurrentRelease` but no declared older releases (so basically the use of the declaration is a bit dubious).

```

1781     \ifx\pkgcls@candidate\empty
1782     \pkgcls@rollbackdate@error{#2}%
1783     \else
1784     \pkgcls@use@this@release\pkgcls@candidate
1785     \pkgcls@releasedate
1786     \fi

```

Otherwise the current file is the right release, so we record that in the transcript and then carry on.

```

1787     \else
1788     \pkgcls@show@selection{current version}{#2}%
1789     \fi
1790     \else % a label request

```

Otherwise we have a rollback request to a named version so we check if that fits the current name and if not give an error as this was the last possible opportunity.

```

1791     \def\reserved@a{#1}%
1792     \ifx\pkgcls@targetlabel\reserved@a
1793     \pkgcls@show@selection{current version}{#2}%
1794     \else
1795     \@latex@error{Requested version '\pkgcls@targetlabel' for
1796     \cls@pkg\space'\@currname' is unknown}\@ehc
1797     \fi
1798     \fi
1799     \fi
1800 }

```

*(End of definition for \DeclareCurrentRelease.)*

**\IfTargetDateBefore** This enables a simple form of conditional code inside a class or package file. If there is a date request and the request date is earlier than the first argument the code in the second argument is processed otherwise the code in the third argument is processed. If there was no date request then we also execute the third argument, i.e., we will get the “latest” version of the file.

Most often the second argument (before-date-code) will be empty.

```

1801 \DeclareRobustCommand\IfTargetDateBefore[1]{%
1802   \ifnum\pkgcls@innerdate <%
1803   \expandafter\@parse@version\expandafter0#1//00\@nil
1804   \typeout{Exclude code introduced on #1}%
1805   \expandafter\@firstoftwo
1806   \else
1807   \typeout{Include code introduced on #1}%
1808   \expandafter\@secondoftwo
1809   \fi
1810 }

```

*(End of definition for \IfTargetDateBefore.)*

```

1811 </2ekernel | latexreleasefirst>

```

## 6 After Preamble

Finally we declare a package that allows all the commands declared above to be `\@onlypreamble` to be used after `\begin{document}`.

```
1812 <*afterpreamble>
1813 \NeedsTeXFormat{LaTeX2e}
1814 \ProvidesPackage{pkgindoc}
1815         [2020-08-08 v1.3m Package Interface in Document (DPC)]
1816 \def\reserved@a#1\do\@classoptionslist#2\do\filecontents#3\relax{%
1817     \gdef\@preamblecmds{#1#3}}
1818 \expandafter\reserved@a\@preamblecmds\relax
1819 </afterpreamble>
```

File 51

## ltkeys.dtx

### 1 Creating and using keyval options

As with any key–value input, using key–value pairs as package or class options has two parts: creating the key options and setting (using) them. Options created in this way *may* be used after package loading as general key–value settings: this will depend on the nature of the underlying code.

---

`\DeclareKeys` `\DeclareKeys [<family>] {<declarations>}`

---

Creates a series of options from a comma-separated *<declarations>* list. The *<family>* is a namespace for the keys; if not given, the basename of the current class or package is used. Each entry in the *<declarations>* (a commas-separated list) is a key–value pair, with the *<key>* having one or more *<properties>*. A small number of “basic” *<properties>* are described below. The full range of properties, provided by `l3keys`, can also be used for more powerful processing. See `interface3` for the full details.

The basic properties provided here are

- `.code` — execute arbitrary code
- `.if` — sets a TeX `\if...` switch
- `.ifnot` — sets an inverted TeX `\if...` switch
- `.pass-to-packages` — for class options, this specifies whether the option should be treated “global” (read by packages from the global list); for package options this property has no effect
- `.store` — stores a value in a macro
- `.usage` — defines whether the option can be given only when loading (`load`), in the preamble (`preamble`) or has no limitation on scope (`general`)

The part of the *<key>* before the *<property>* is the *<name>*, with the *<value>* working with the *<property>* to define the behaviour of the option.

For example, with

```
\DeclareKeys[mypkg]
{
  draft.if           = @mypkg@draft      ,
  draft.usage        = preamble          ,
  name.store         = \@mypkg@name      ,
  name.usage         = load              ,
  second-name.store  = \@mypkg@other@name
}
```

three options would be create. The option `draft` can be given anywhere in the preamble, and will set a switch called `\if@mypkg@draft`. The option `name` can only be given during package loading, and will save whatever value it is given in `\@mypkg@name`. Finally, the option `second-name` can be given anywhere, and will save its value in `\@mypkg@other@name`.

Keys created *before* the use of `\ProcessKeyOptions` act as package options.

---

`\DeclareUnknownKeyHandler` `\DeclareUnknownKeyHandler [<family>] {<code>}`

---

The function `\DeclareUnknownKeyHandler` may be used to define the behavior when an undefined key is encountered. The *<code>* will receive the unknown key name as `#1` and the value as `#2`. These can then be processed as appropriate, e.g. by forwarding to another package.

---

`\ProcessKeyOptions` `\ProcessKeyOptions [⟨families⟩]`

---

The `\ProcessKeyOptions` function is used to check the current option list against the keys defined for `⟨families⟩` (a comma-separated list). Global (class) options and local (package) options are checked when this function is called in a package. Where there is more than one `⟨family⟩` in the list of `⟨families⟩`, processing takes place in the order of the `⟨families⟩`. Every key known in a `⟨family⟩` is passed for processing, thus a key defined in more than one `⟨family⟩` will be processed several times, and if the code paths are shared, the outcome will be determined by the last entry in the list of `⟨families⟩`.

---

`\SetKeys` `\SetKeys [⟨family⟩] {⟨keyvals⟩}`

---

Sets (applies) the explicit list of `⟨keyvals⟩` for the `⟨family⟩`: if the latter is not given, the value of `\@currname` is used. This command may be used within a package to set options before or after using `\ProcessKeyOptions`.

## 1.1 Implementation of `ltkeys`

```

1 <@=keys>
2 <*2ekernel>
3 \ExplSyntaxOn

```

## 1.2 Key properties

```

.code
  .if      4 \group_begin:
.ifnot    5 \cs_set_protected:Npn \__keys_tmp:nn #1#2
.store    6 {
.usage    7 \quark_if_recursion_tail_stop:n {#1}
          8 \cs_new_eq:cc
          9 { \c__keys_props_root_str . #2 }
         10 { \c__keys_props_root_str . #1 }
         11 \__keys_tmp:nn
         12 }
         13 \__keys_tmp:nn
         14 { code:n } { code }
         15 { legacy_if_set:n } { if }
         16 { legacy_if_set_inverse:n } { ifnot }
         17 { tl_set:N } { store }
         18 { usage:n } { usage }
         19 { \q_recursion_tail } { }
         20 \q_recursion_stop
         21 \group_end:

```

(End of definition for `.code` and others.)

`.pass-to-packages` Used to force options to be global: as this property (uniquely) has an *optional* value, there is a bit of work to do.

```

\__keys_scope:n
\__keys_scope:N 22 \cs_new_protected:cpn { \c__keys_props_root_str .pass-to-packages }
                23 {
                24 \bool_if:NTF \l__keys_no_value_bool
                25 { \__keys_scope:n { true } }
                26 { \__keys_scope:n }

```

```

27 }
28 \cs_new_protected:Npn \__keys_scope:n #1
29 {
30   \str_case:nnF {#1}
31   {
32     { true }
33     { \__keys_scope:N \clist_put_right:NV }
34     { false }
35     { \__keys_scope:N \clist_remove_all:NV }
36   }
37   {
38     \msg_error:nnnn { keys }
39     { choice-unknown }
40     { .pass-to-packages }
41     {#1}
42   }
43 }
44 \cs_new_protected:Npn \__keys_scope:N #1
45 {
46   \exp_after:wN \__keys_find_key_module:wNN
47   \l_keys_path_str \s_keys_stop
48   \l_keys_key_tl \l_keys_key_str
49   #1 \l__keys_forced_global_clist \l_keys_key_str
50 }

```

(End of definition for `.pass-to-packages`, `\__keys_scope:n`, and `\__keys_scope:N`.)

### 1.3 Main mechanism

```

51 \cs_generate_variant:Nn \clist_if_in:NnT { Ne }
52 \cs_generate_variant:Nn \clist_if_in:NnTF { Ne }
53 \cs_generate_variant:Nn \clist_put_right:Nn { Nv }

```

`\l__keys_class_only_clist` Used to track class-only options.

```
54 \clist_new:N \l__keys_class_only_clist
```

(End of definition for `\l__keys_class_only_clist`.)

`\l__keys_forced_global_clist` Used to force options to be global.

```
55 \clist_new:N \l__keys_forced_global_clist
```

(End of definition for `\l__keys_forced_global_clist`.)

`\l__keys_options_clist` A single list is used for all options, into which they are collected before processing.

```
56 \clist_new:N \l__keys_options_clist
```

(End of definition for `\l__keys_options_clist`.)

`\l__keys_local_clist` Holds the local options when appropriate: otherwise empty. Needed as the  $\text{\LaTeX} 2_{\epsilon}$  setup here can be equal to `\scan_stop:`, which is not generally supported.

```
57 \clist_new:N \l__keys_local_clist
```

(End of definition for \l\_\_keys\_local\_clist.)

---

\l\_\_keys\_options\_loading\_bool

---

Used to indicate we are in the loading phase: controls the outcome of warnings.

```
58 \bool_new:N \l__keys_options_loading_bool
```

```
\__keys_options:n
\__keys_options_aux:n
```

The main function calls functions to collect up the global and local options into \l\_\_keys\_options\_clist before calling the underlying functions to actually do the processing. So that a suitable message is produced if the option is unknown, the special **unknown** key is set if it does not already exist for the current family, and is cleaned up afterwards if required. To allow the L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub> layer to know this mechanism is active, and to deal with the key family not matching the file name, we store the family in all cases. Global options are only considered the first time a package is loaded: this is tracked using `opt@handler@ \currname . \currentx`, as this is defined once keyval processing has been applied for the first time.

```
59 \cs_new_protected:Npn \__keys_options:n #1
60 { \__keys_options_expand_module:Nn \__keys_options_aux:n {#1} }
61 \cs_new_protected:Npn \__keys_options_aux:n #1
62 {
63   \__keys_options_local:
64   \clist_map_inline:nn {#1}
65   {
66     \clist_clear:N \l__keys_options_clist
67     \cs_if_exist:cF { opt@handler@ \currname . \currentx }
68     { \__keys_options_global:n {##1} }
69     \__keys_options_local:n {##1}
70     \bool_set_true:N \l__keys_options_loading_bool
71     \clist_map_variable:NNn \l__keys_options_clist \CurrentOption
72     { \keys_set:nV {#1} \CurrentOption }
73     \bool_set_false:N \l__keys_options_loading_bool
74     \__keys_options_loaded:n {##1}
75   }
76   \clist_if_empty:NF \l__keys_unused_clist
77   {
78     \clist_map_inline:Nn \l__keys_unused_clist
79     {
80       \msg_error:nnxx { keys } { option-unknown }
81       {##1} { \currname }
82     }
83   }
84   \cs_if_exist:cF { opt@handler@ \currname . \currentx }
85   {
86     \cs_gset_protected:cpn { opt@handler@ \currname . \currentx }
87     { \ProcessKeyOptions [ {#1} ] }
88   }
89   \AtEndOfPackage { \cs_set_eq:NN \unprocessedoptions \scan_stop: }
90 }

91 \msg_new:nnnn { keys } { option-unknown }
92 { Unknown-option~'#1'~for~package~#2. }
93 {
94   LaTeX-has-been-asked-to-set-an-option-called~'#1'~
```

```

95     but~the~package~"\msg_module_name:n {#2}"~has~not~created~an~option~with~this~name.
96   }

```

(End of definition for `\__keys_options:n` and `\__keys_options_aux:n`.)

`\__keys_options_global:n` Global (class) options are handled differently for L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub> packages and classes. Hence this function is essentially a check on the current file type. The initial test is needed as L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub> allows variables to be equal to `\scan_stop:`, which is usually forbidden in expl3 code.

```

97 \cs_new_protected:Npn \__keys_options_global:n #1
98 {
99   \cs_if_eq:NNF \@raw@classoptionslist \scan_stop:
100   {
101     \cs_if_eq:NNTF \@currentx \@clsextension
102     { \__keys_options_class:n {#1} }
103     { \__keys_options_package:n {#1} }
104   }
105 }

```

(End of definition for `\__keys_options_global:n`.)

`\__keys_options_class:n` For classes, each option (stripped of any content after =) is checked for existence as a key.  
`\__keys_options_class:nnn` If found, the option is added to the combined list for processing. On the other hand,  
`\__keys_options_class:nn` unused options are stored up in `\@unusedoptionlist`. An earlier version of this code checked for the `unknown` key just once and if found short-cutted the loop: that though makes handling more complex situations harder, so we take the performance hit instead. Options used by classes are tracked but the catch-all `unknown` is excluded (hence not using a lazy evaluation for the key testing).

```

106 \cs_new_protected:Npn \__keys_options_class:n #1
107 {
108   \cs_if_free:cF { \@raw@opt@ \@currname . \@currentx }
109   {
110     \clist_map_inline:cn { \@raw@opt@ \@currname . \@currentx }
111     {
112       \exp_args:Ne \__keys_options_class:nnn
113       { \tl_trim_spaces:e { \__keys_remove_equals:n {##1} } }
114       {##1} {#1}
115     }
116   }
117 }
118 \cs_new_protected:Npn \__keys_options_class:nnn #1#2#3
119 {
120   \keys_if_exist:nnTF {#3} {#1}
121   {
122     \__keys_options_class:nn {#1} {#2}
123     \clist_put_right:Ne \l__keys_class_only_clist { \tl_to_str:n {#1} }
124   }
125   {
126     \keys_if_exist:nnTF {#3} { unknown }
127     { \__keys_options_class:nn {#1} {#2} }
128     {
129       \clist_if_in:NnF \@unusedoptionlist {#1}
130       { \clist_put_right:Nn \@unusedoptionlist {#1} }
131     }
132   }
133 }

```

```

132     }
133   }
134   \cs_new_protected:Npn \__keys_options_class:nn #1#2
135   {
136     \clist_remove_all:Nn \@unusedoptionlist {#1}
137     \clist_put_right:Nn \l__keys_options_clist {#2}
138   }

(End of definition for \__keys_options_class:n, \__keys_options_class:nnn, and
 \__keys_options_class:nn.)

```

`\__keys_options_package:n` For global options when processing a package, the tasks are slightly different from those for a class. The check is the same, but here there is nothing to do if the option is not applicable. Each valid option also needs to be removed from `\@unusedoptionlist`.

```

139   \cs_new_protected:Npn \__keys_options_package:n #1
140   {
141     \clist_map_inline:Nn \@raw@classoptionslist
142     {
143       \exp_args:Ne \__keys_options_package:nnn
144       { \tl_trim_spaces:e { \__keys_remove_equals:n {##1} } }
145       {##1} {#1}
146     }
147   }

```

The forced-global test here needs to use `\tl_to_str:n` as the data come from a key name, which is always a string.

```

148   \cs_new_protected:Npn \__keys_options_package:nnn #1#2#3
149   {
150     \keys_if_exist:nnT {#3} {#1}
151     {
152       \clist_if_in:NeTF \l__keys_class_only_clist { \tl_to_str:n {#1} }
153       {
154         \clist_if_in:NeT \l__keys_forced_global_clist { \tl_to_str:n {#1} }
155         { \__keys_options_package:nn {#1} {#2} }
156       }
157       { \__keys_options_package:nn {#1} {#2} }
158     }
159   }
160   \cs_new_protected:Npn \__keys_options_package:nn #1#2
161   {
162     \clist_put_right:Nn \l__keys_options_clist {#2}
163     \clist_remove_all:Nn \@unusedoptionlist {#1}
164   }

```

(End of definition for `\__keys_options_package:n`, `\__keys_options_package:nnn`, and `\__keys_options_package:nn`.)

`\__keys_options_local:` If local options are found, they are added to the processing list. L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub> stores options for each file in a macro which may or may not exist, hence the need to use `\cs_if_exist:c`. For tracking the unused options, we need to hold only the option name, hence needing a mapping.

```

165   \cs_new_protected:Npn \__keys_options_local:
166   {
167     \clist_clear:N \l__keys_local_clist
168     \cs_if_eq:NNF \@current \cclsextension

```

```

169     {
170       \cs_if_exist:cT { @raw@opt@ \@currname . \@currentx }
171       {
172         \clist_set_eq:Nc \l__keys_local_clist
173           { @raw@opt@ \@currname . \@currentx }
174       }
175     }
176     \clist_map_inline:Nn \l__keys_local_clist
177     {
178       \clist_put_right:Ne \l__keys_unused_clist
179       { \tl_trim_spaces:e { \__keys_remove_equals:n {##1} } }
180     }
181   }

```

(End of definition for \\_\_keys\_options\_local:.)

\\_\_keys\_options\_local:n    A simpler version of the code used for package options: we stack up those that are known,  
 \\_\_keys\_options\_local:nnn unless the family supports unknown keys in which case we hover up everything.

```

182 \cs_new_protected:Npn \__keys_options_local:n #1
183 {
184   \keys_if_exist:nnTF {#1} { unknown }
185   {
186     \clist_put_right:NV \l__keys_options_clist \l__keys_local_clist
187     \clist_clear:N \l__keys_unused_clist
188   }
189   {
190     \clist_map_inline:Nn \l__keys_local_clist
191     {
192       \exp_args:Ne \__keys_options_local:nnn
193       { \tl_trim_spaces:e { \__keys_remove_equals:n {##1} } }
194       {##1} {#1}
195     }
196   }
197 }
198 \cs_new_protected:Npn \__keys_options_local:nnn #1#2#3
199 {
200   \keys_if_exist:nnT {#3} {#1}
201   {
202     \clist_put_right:Nn \l__keys_options_clist {#2}
203     \clist_remove_all:Nn \l__keys_unused_clist {#1}
204   }
205 }

```

(End of definition for \\_\_keys\_options\_local:n and \\_\_keys\_options\_local:nnn.)

\\_\_keys\_remove\_equals:n    As the name suggests, this is a simple function to remove an equals sign from the input.  
 \\_\_keys\_remove\_equals:w    This is all wrapped up in an n function so that there will always be a sign available.

```

206 \cs_new:Npn \__keys_remove_equals:n #1
207   { \__keys_remove_equals:w #1 = \s__keys_stop }
208 \cs_new:Npn \__keys_remove_equals:w #1 = #2 \s__keys_stop { \exp_not:n {#1} }

```

(End of definition for \\_\_keys\_remove\_equals:n and \\_\_keys\_remove\_equals:w.)

## 1.4 The document interfaces

```
209 \cs_generate_variant:Nn \keys_define:nn { nx }
```

```
\__keys_options_expand_module:Nn
\__keys_options_expand_module:nN
```

To deal with active characters inside the module argument whilst also expanding that argument, we use a combination of c- and f-type expansion. This works as the definitions for active UTF-8 bytes contain an `\ifincsname` test.

```
210 \cs_new_protected:Npn \__keys_options_expand_module:Nn #1#2
211 {
212   \cs:w __keys_options_expand_module:nN \use:e { \cs_end: {#2} } #1
213 }
214 \cs_new_protected:Npn \__keys_options_expand_module:nN #1#2
215 { #2 {#1} }
```

(End of definition for `\__keys_options_expand_module:Nn` and `\__keys_options_expand_module:nN`.)

**`\DeclareKeys`** Defining key options is quite straight-forward: we have an intermediate function to allow for potential set-up steps.

```
216 \NewDocumentCommand \DeclareKeys { 0 { \@currname } +m }
217 { \__keys_options_expand_module:Nn \keys_define:nn {#1} {#2} }
```

(End of definition for `\DeclareKeys`. This function is documented on page 1105.)

**`\DeclareUnknownKeyHandler`**

```
218 \NewDocumentCommand \DeclareUnknownKeyHandler { 0 { \@currname } +m }
219 {
220   \cs_set_protected:cpn { __keys_unknown_handler_ #1 :nn } ##1##2 {#2}
221   \__keys_options_expand_module:Nn \keys_define:nx {#1}
222   {
223     unknown .code:n =
224       \exp_not:N \exp_args:NV
225       \exp_not:c { __keys_unknown_handler_ #1 :nn }
226       \exp_not:N \l_keys_key_str {###1}
227   }
228 }
```

(End of definition for `\DeclareUnknownKeyHandler`. This function is documented on page 1105.)

**`\ProcessKeyOptions`** We need to deal with the older interface from `l3keys2e` here: it had a mandatory argument. We can mop that up using a look-ahead, and then exploit that information to determine whether the package option handling is set up for the new approach for clash handling.

```
229 \NewDocumentCommand \ProcessKeyOptions { 0 { \@currname } }
230 { \__keys_options:n {#1} }
231 \@onlypreamble \ProcessKeyOptions
```

(End of definition for `\ProcessKeyOptions`. This function is documented on page 1106.)

## 1.5 Option usage scope

`\__keys_options_loaded:n` Indicates that the load-time options for a package have been processed: once this has happened, make them unavailable either with a warning or an error.

```

232 \cs_new_protected:Npn \__keys_options_loaded:n #1
233 {
234   \prop_get:NnNT \l_keys_usage_load_prop {#1} \l_keys_tmpa_tl
235   {
236     \clist_map_inline:Nn \l_keys_tmpa_tl
237     {
238       \keys_define:nn {#1}
239       {
240         ##1 .code:n =
241           \__keys_options_loaded:nn {#1} {##1}
242       }
243     }
244   }
245 }
246 \cs_new_protected:Npn \__keys_options_loaded:nn #1#2
247 {
248   \bool_if:NTF \l_keys_options_loading_bool
249   { \msg_warning:nnnn { keys } { load-option-ignored } }
250   { \msg_error:nnnn { keys } { load-only } }
251   {#1} {#2}
252 }
253 \msg_new:nnn { keys } { load-option-ignored }
254 {
255   Package~"\msg_module_name:n {#1}"~has~already~been~loaded:~
256   ignoring~load-time~option~"#2".
257 }
258 \msg_new:nnnn { keys } { load-only }
259 {
260   Key~"#2"~may~only~be~used~during~loading~of~package~
261   "\msg_module_name:n {#1}".
262 }
263 {
264   LaTeX~was~asked~to~set~a~key~called~"#2",~but~this~is~only~allowed~
265   in~the~optional~argument~when~loading~package~"\msg_module_name:n {#1}".
266 }

```

(End of definition for `\__keys_options_loaded:n` and `\__keys_options_loaded:nn`.)

Disable all preamble options in one shot.

```

267 \tl_gput_left:Nn \@kernel@after@begindocument
268 {
269   \prop_map_inline:Nn \l_keys_usage_preamble_prop
270   {
271     \clist_map_inline:nn {#2}
272     {
273       \keys_define:nn {#1}
274       {
275         ##1 .code:n =
276           \msg_error:nnn { keys } { preamble-only } {##1}
277       }

```

```

278     }
279   }
280 }
281 \msg_new:nnnn { keys } { preamble-only }
282 { Key~"#1"~may~only~be~used~in~the~preamble. }
283 {
284   LaTeX~was~asked~to~set~a~key~called~"#1",~but~this~is~only~allowed~
285   before~\begin{document}.~You~will~need~to~set~the~key~earlier.
286 }

```

## 1.6 General key setting

**\SetKeys** A simple wrapper.

```

287 \NewDocumentCommand \SetKeys { 0 { \@currname } +m }
288 { \__keys_options_expand_module:Nn \keys_set:nn {#1} {#2} }

```

*(End of definition for \SetKeys. This function is documented on page [1106](#).)*

```

289 \ExplSyntaxOff
290 </2ekernel>

```

## File 52

# ltfilehook.dtx

## 1 Introduction

### 1.1 Provided hooks

The code offers a number of hooks into which packages (or the user) can add code to support different use cases. Many hooks are offered as pairs (i.e., the second hook is reversed). Also important to know is that these pairs are properly nested with respect to other pairs of hooks.

There are hooks that are executed for all files of a certain type (if they contain code), e.g., for all “include files” or all “packages”, and there are also hooks that are specific to a single file, e.g., do something after the package `foo.sty` has been loaded.

### 1.2 General hooks for file reading

There are four hooks that are called for each file that is read using document-level commands such as `\input`, `\include`, `\usepackage`, etc. They are not called for files read using internal low-level methods, such as `\@input` or `\openin`.

<code>file/before</code> <code>file/.../before</code> <code>file/.../after</code> <code>file/after</code>	These are:  <b><code>file/before</code>, <code>file/⟨file-name⟩/before</code></b> These hooks are executed in that order just before the file is loaded for reading. The code of the first hook is used with every file, while the second is executed only for the file with matching <code>⟨file-name⟩</code> allowing you to specify code that only applies to one file.
--	--

**`file/⟨file-name⟩/after`, `file/after`** These hooks are executed after the file with name `⟨file-name⟩` has been fully consumed. The order is swapped (the specific one comes first) so that the `/before` and `/after` hooks nest properly, which is important if any of them involve grouping (e.g., contain environments, for example). Furthermore both hooks are reversed hooks to support correct nesting of different packages adding code to both `/before` and `/after` hooks.

So the overall sequence of hook processing for any file read through the user interface commands of L<sup>A</sup>T<sub>E</sub>X is:

```
\UseHook{file/before}
\UseHook{file/⟨file name⟩/before}
  ⟨file contents⟩
\UseHook{file/⟨file name⟩/after}
\UseHook{file/after}
```

The file hooks only refer to the file by its name and extension, so the `⟨file name⟩` should be the file name as it is on the filesystem with extension (if any) and without paths. Different from `\input` and similar commands, the `.tex` extension is not assumed in hook `⟨file name⟩`, so `.tex` files must be specified with their extension to be recognized. Files within subfolders should also be addressed by their name and extension only.

Extensionless files also work, and should then be given without extension. Note however that T<sub>E</sub>X prioritizes `.tex` files, so if two files `foo` and `foo.tex` exist in the search path, only the latter will be seen.

When a file is input, the `<file name>` is available in `\CurrentFile`, which is then used when accessing the `file/<file name>/before` and `file/<file name>/after`.

---

<code>\CurrentFile</code>	The name of the file about to be read (or just finished) is available to the hooks through <code>\CurrentFile</code> (there is no <code>expl3</code> name for it for now). The file is always provided with its extension, i.e., how it appears on your hard drive, but without any specified path to it. For example, <code>\input{sample}</code> and <code>\input{app/sample.tex}</code> would both have <code>\CurrentFile</code> being <code>sample.tex</code> .
---------------------------	--

---

<code>\CurrentFilePath</code>	The path to the current file (complement to <code>\CurrentFile</code> ) is available in <code>\CurrentFilePath</code> if needed. The paths returned in <code>\CurrentFilePath</code> are only user paths, given through <code>\input@path</code> (or <code>expl3</code> 's equivalent <code>\l_file_search_path_seq</code> ) or by directly typing in the path in the <code>\input</code> command or equivalent. Files located by <code>kpsewhich</code> get the path added internally by the T <sub>E</sub> X implementation, so at the macro level it looks as if the file were in the current folder, so the path in <code>\CurrentFilePath</code> is empty in these cases (package and class files, mostly).
-------------------------------	--

---

<code>\CurrentFileUsed</code> <code>\CurrentFilePathUsed</code>	In normal circumstances these are identical to <code>\CurrentFile</code> and <code>\CurrentFilePath</code> . They will differ when a file substitution has occurred for <code>\CurrentFile</code> . In that case, <code>\CurrentFileUsed</code> and <code>\CurrentFilePathUsed</code> will hold the actual file name and path loaded by L <sup>A</sup> T <sub>E</sub> X, while <code>\CurrentFile</code> and <code>\CurrentFilePath</code> will hold the names that were <i>asked for</i> . Unless doing very specific work on the file being read, <code>\CurrentFile</code> and <code>\CurrentFilePath</code> should be enough.
--	---

### 1.3 Hooks for package and class files

Commands to load package and class files (e.g., `\usepackage`, `\RequirePackage`, `\LoadPackageWithOptions`, etc.) offer the hooks from section 1.2 when they are used to load a package or class file, e.g., `file/array.sty/after` would be called after the `array` package got loaded. But as packages and classes form as special group of files, there are some additional hooks available that only apply when a package or class is loaded.

---

<code>package/before</code> <code>package/after</code> <code>package/.../before</code> <code>package/.../after</code> <code>class/before</code> <code>class/after</code> <code>class/.../before</code> <code>class/.../after</code>	<p>These are:</p> <p><b><code>package/before</code>, <code>package/after</code></b> These hooks are called for each package being loaded.</p> <p><b><code>package/&lt;name&gt;/before</code>, <code>package/&lt;name&gt;/after</code></b> These hooks are additionally called if the package name is <code>&lt;name&gt;</code> (without extension).</p> <p><b><code>class/before</code>, <code>class/after</code></b> These hooks are called for each class being loaded.</p> <p><b><code>class/&lt;name&gt;/before</code>, <code>class/&lt;name&gt;/after</code></b> These hooks are additionally called if the class name is <code>&lt;name&gt;</code> (without extension).</p>
--	---

All `/after` hooks are implemented as reversed hooks.

The overall sequence of execution for `\usepackage` and friends is:

```
\UseHook{package/before}
\UseOneTimeHook{package/<package name>/before}

  \UseHook{file/before}
  \UseHook{file/<package name>.sty/before}
  <package contents>
  \UseHook{file/<package name>.sty/after}
  \UseHook{file/after}

code from \AtEndOfPackage if used inside the package

\UseOneTimeHook{package/<package name>/after}
\UseHook{package/after}
```

and similar for class file loading, except that `package/` is replaced by `class/` and `\AtEndOfPackage` by `\AtEndOfClass`.

If a package or class is not loaded none of the hooks are executed!

All class or package hooks involving the name of the class or package are implemented as one-time hooks, whereas all other such hooks are normal hooks. This allows for the following use case

```
\AddToHook{package/varioref/after}
{ ... apply my customizations if the package gets
  loaded (or was loaded already) ... }
```

without the need to first test if the package is already loaded.

## 1.4 Hooks for `\include` files

To manage `\include` files, L<sup>A</sup>T<sub>E</sub>X issues a `\clearpage` before and after loading such a file. Depending on the use case one may want to execute code before or after these `\clearpages` especially for the one that is issued at the end.

Executing code before the final `\clearpage`, means that the code is processed while the last page of the included material is still under construction. Executing code after it means that all floats from inside the include file are placed (which might have added further pages) and the final page has finished.

Because of these different scenarios we offer hooks in three places.<sup>53</sup> None of the hooks are executed when an `\include` file is bypassed because of an `\includeonly` declaration. They are, however, all executed if L<sup>A</sup>T<sub>E</sub>X makes an attempt to load the `\include` file (even if it doesn't exist and all that happens is “No file `<filename>.tex`”).

---

<sup>53</sup>If you want to execute code before the first `\clearpage` there is no need to use a hook—you can write it directly in front of the `\include`.

<code>include/before</code>	These are:
<code>include/.../before</code>	
<code>include/end</code>	<b><code>include/before, include/&lt;name&gt;/before</code></b> These hooks are executed (in that order) after the initial <code>\clearpage</code> and after <code>.aux</code> file is changed to use <code>&lt;name&gt;.aux</code> , but
<code>include/.../end</code>	before the <code>&lt;name&gt;.tex</code> file is loaded. In other words they are executed at the very
<code>include/after</code>	beginning of the first page of the <code>\include</code> file.
<code>include/.../after</code>	

**`include/<name>/end, include/end`** These hooks are executed (in that order) after `LATEX` has stopped reading from the `\include` file, but before it has issued a `\clearpage` to output any deferred floats.

**`include/<name>/after, include/after`** These hooks are executed (in that order) after `LATEX` has issued the `\clearpage` but before it has switched back writing to the main `.aux` file. Thus technically we are still inside the `\include` and if the hooks generate any further typeset material including anything that writes to the `.aux` file, then it would be considered part of the included material and bypassed if it is not loaded because of some `\includeonly` statement.<sup>54</sup>

**`include/excluded, include/<name>/excluded`** The above hooks for `\include` files are only executed when the file is loaded (or more exactly the load is attempted). If, however, the `\include` file is explicitly excluded (through an `\includeonly` statement) the above hooks are bypassed and instead the `include/excluded` hook followed by the `include/<name>/excluded` hook are executed. This happens after `LATEX` has loaded the `.aux` file for this include file, i.e., after `LATEX` has updated its counters to pretend that the file was seen.

All `include` hooks involving the name of the included file are implemented as one-time hooks (whereas all other such hooks are normal hooks).

If you want to execute code that is run for every `\include` regardless of whether or not it is excluded, use the `cmd/include/before` or `cmd/include/after` hooks.

## 1.5 High-level interfaces for `LATEX`

We do not provide any additional wrappers around the hooks (like `filehook` or `scrfile` do) because we believe that for package writers the high-level commands from the hook management, e.g., `\AddToHook`, etc. are sufficient and in fact easier to work with, given that the hooks have consistent naming conventions.

<sup>54</sup>For that reason another `\clearpage` is executed after these hooks which normally does nothing, but starts a new page if further material got added this way.

## 1.6 Kernel, class, and package interfaces for L<sup>A</sup>T<sub>E</sub>X

---

<code>\declare@file@substitution</code>	<code>\declare@file@substitution {&lt;file&gt;} {&lt;replacement-file&gt;}</code>
<code>\undeclare@file@substitution</code>	<code>\undeclare@file@substitution {&lt;file&gt;}</code>

---

If `<file>` is requested for loading replace it with `<replacement-file>`. `\CurrentFile` remains pointing to `<file>` but `\CurrentFileUsed` will show the file actually loaded.

The main use case for this declaration is to provide a corrected version of a package that can't be changed (due to its license) but no longer functions because of L<sup>A</sup>T<sub>E</sub>X kernel changes, for example, or to provide a version that makes use of new kernel functionality while the original package remains available for use with older releases. As such it is mainly meant for use in the L<sup>A</sup>T<sub>E</sub>X kernel but other use cases are conceivable.

The `\undeclare@file@substitution` declaration undoes a substitution made earlier.

*Please do not misuse this functionality and replace a file with another unless if really needed and only if the new version is implementing the same functionality as the original one!*

---

<code>\disable@package@load</code>	<code>\disable@package@load {&lt;package&gt;} {&lt;alternate-code&gt;}</code>
<code>\reenable@package@load</code>	<code>\reenable@package@load {&lt;package&gt;}</code>

---

If `<package>` is requested, do not load it but instead run `<alternate-code>` which could issue a warning, error or any other code.

The main use case is for classes that want to restrict the set of supported packages or contain code that make the use of some packages impossible. So rather than waiting until the document breaks they can set up informative messages why certain packages are not available.

The function is only implemented for packages not for arbitrary files and again it should only be applied if there are good reasons for doing this.<sup>55</sup>

## 1.7 A sample package for structuring the log output

As an application we provide the package `structuredlog` that adds lines to the `.log` when a file is opened and closed for reading keeping track of nesting level as well. For example, for the current document it adds the lines

```
= (LEVEL 1 START) t1lmr.fd
= (LEVEL 1 STOP) t1lmr.fd
= (LEVEL 1 START) supp-pdf.mkii
= (LEVEL 1 STOP) supp-pdf.mkii
= (LEVEL 1 START) nameref.sty
== (LEVEL 2 START) refcount.sty
== (LEVEL 2 STOP) refcount.sty
== (LEVEL 2 START) gettitlestring.sty
== (LEVEL 2 STOP) gettitlestring.sty
= (LEVEL 1 STOP) nameref.sty
= (LEVEL 1 START) ltfilehook-doc.out
```

---

<sup>55</sup>Just to be sure: “I don’t like this package by somebody else” is not a good one :-)

```

= (LEVEL 1 STOP) ltfilehook-doc.out
= (LEVEL 1 START) ltfilehook-doc.out
= (LEVEL 1 STOP) ltfilehook-doc.out
= (LEVEL 1 START) ltfilehook-doc.hd
= (LEVEL 1 STOP) ltfilehook-doc.hd
= (LEVEL 1 START) ltfilehook.dtx
== (LEVEL 2 START) otllmr.fd
== (LEVEL 2 STOP) otllmr.fd
== (LEVEL 2 START) omllmm.fd
== (LEVEL 2 STOP) omllmm.fd
== (LEVEL 2 START) omslmsy.fd
== (LEVEL 2 STOP) omslmsy.fd
== (LEVEL 2 START) omxlmex.fd
== (LEVEL 2 STOP) omxlmex.fd
== (LEVEL 2 START) umsa.fd
== (LEVEL 2 STOP) umsa.fd
== (LEVEL 2 START) umsb.fd
== (LEVEL 2 STOP) umsb.fd
== (LEVEL 2 START) tsllmr.fd
== (LEVEL 2 STOP) tsllmr.fd
== (LEVEL 2 START) tllmss.fd
== (LEVEL 2 STOP) tllmss.fd
= (LEVEL 1 STOP) ltfilehook.dtx

```

Thus if you inspect an issue in the .log it is easy to figure out in which file it occurred, simply by searching back for LEVEL and if it is a STOP then remove 1 from the level value and search further for LEVEL with that value which should then be the START level of the file you are in.

## 2 The Implementation

```

1 <*2kernel>
2 <@@=filehook>

```

### 2.1 Document and package-level commands

**\CurrentFile** User-level macros that hold the current file name and file path. These are used internally as well because the code takes care to protect against a possible redefinition of these macros in the loaded file (it's necessary anyway to make hooks work with nested \input).  
**\CurrentFilePath** The versions \...Used hold the *actual* file name and path that is loaded by L<sup>A</sup>T<sub>E</sub>X, whereas the other two hold the name as requested. They will differ in case there's a file substitution.  
**\CurrentFileUsed**  
**\CurrentFilePathUsed**

```

3 </2kernel>
4 <*2kernel | latexrelease>
5 <latexrelease>\IncludeInRelease{2020/10/01}%
6 <latexrelease>          {\CurrentFile}{Hook management file}%
7 \ExplSyntaxOn
8 \tl_new:N \CurrentFile
9 \tl_new:N \CurrentFilePath
10 \tl_new:N \CurrentFileUsed
11 \tl_new:N \CurrentFilePathUsed

```

```

12 \ExplSyntaxOff
13 </2ekernel | latexrelease>
14 <latexrelease>\EndIncludeInRelease

15 <latexrelease>\IncludeInRelease{0000/00/00}%
16 <latexrelease>                {\CurrentFile}{Hook management file}%
17 <latexrelease>
18 <latexrelease>\let \CurrentFile          \@undefined
19 <latexrelease>\let \CurrentFilePath      \@undefined
20 <latexrelease>\let \CurrentFileUsed     \@undefined
21 <latexrelease>\let \CurrentFilePathUsed \@undefined
22 <latexrelease>
23 <latexrelease>\EndIncludeInRelease
24 <*2ekernel>

```

(End of definition for `\CurrentFile` and others. These functions are documented on page 1116.)

## 2.2 expl3 helpers

```

25 </2ekernel>
26 <*2ekernel | latexrelease>
27 <latexrelease>\IncludeInRelease{2020/10/01}%
28 <latexrelease>                {\_filehook_file_parse_full_name:nN}{File helpers}%
29 \ExplSyntaxOn

```

`\_filehook_file_parse_full_name:nN`  
`\_filehook_full_name:nn`

A utility macro to trigger expl3's file-parsing and lookup, and return a normalized representation of the file name. If the queried file doesn't exist, no normalization takes place. The output of `\_filehook_file_parse_full_name:nN` is passed on to the #2—a 3-argument macro that takes the `<path>`, `<base>`, and `<ext>` parts of the file name.

```

30 \cs_new:Npn \_filehook_file_parse_full_name:nN #1
31 {
32   \exp_args:Nf \file_parse_full_name_apply:nN
33   {
34     \exp_args:Nf \_filehook_full_name:nn
35     { \file_full_name:n {#1} } {#1}
36   }
37 }
38 \cs_new:Npn \_filehook_full_name:nn #1 #2
39 {
40   \tl_if_empty:nTF {#1}
41   { \tl_trim_spaces:n {#2} }
42   { \tl_trim_spaces:n {#1} }
43 }

```

(End of definition for `\_filehook_file_parse_full_name:nN` and `\_filehook_full_name:nn`.)

`\_filehook_if_no_extension:nTF`  
`\_filehook_drop_extension:N`

Some actions depend on whether the file extension was explicitly given, and sometimes the extension has to be removed. The macros below use `\_filehook_file_parse_full_name:nN` to split up the file name and either check if `<ext>` (#3) is empty, or discard it.

```

44 \cs_new:Npn \_filehook_if_no_extension:nTF #1
45 {
46   \exp_args:Ne \tl_if_empty:nTF

## 2.3 Declaring the file-related hooks

These hooks have names with three-parts that start with `file/`, `include/`, `class/` or `package/` and end with `/before` or `/after` (or `/end` in the case of `include/`). They are all generic hooks so will be declared only if code is added to them; this declaration is done for you automatically and, indeed, they should not be declared explicitly.

Those named `.../after` and `include/.../end` are, when code is added, declared as reversed hooks.

## 2.4 Patching L<sup>A</sup>T<sub>E</sub>X’s `\InputIfFileExists` command

Most of what we have to do is adding `\UseHook` into several L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub> core commands, because of some circular dependencies in the kernel we do this only now and not in `ltfiles`.

`\InputIfFileExists` `\InputIfFileExists` loads any file if it is available so we have to add the hooks `file/before` and `file/after` in the right places. If the file doesn’t exist no hooks should be executed.

```
143 </2ekernel>
144 <latexrelease>\IncludeInRelease{2020/10/01}%
145 <latexrelease>          {\InputIfFileExists}{Hook management (files)}%
146 <*2ekernel|latexrelease>

147 \let\InputIfFileExists\@undefined
148 \DeclareRobustCommand \InputIfFileExists[2]{%
149   \IfFileExists{#1}%
150   {%
151     \@expl@@@filehook@file@push@@
152     \@filehook@set@CurrentFile
```

We pre-expand `\@filef@und` so that in case another file is loaded in the true branch of `\InputIfFileExists`, these don’t change their value meanwhile. This isn’t a worry with `\CurrentFile...` because they are kept in a stack.

```
153   \expandafter\@swaptwoargs\expandafter
154   {\expandafter\@input@file@exists@with@hooks
155     \expandafter{\@filef@und}}%
156   {#2}%
157   \@expl@@@filehook@file@pop@@
158 }%
159 }
160 \def\@input@file@exists@with@hooks#1{%
```

If the file exists then `\CurrentFile` holds its name. But we can’t rely on that still being true after the file has been processed. Thus for using the name in the file hooks we need to preserve the name and then restore it for the `file/.../after` hook.

The hook always refers to the file requested by the user. The hook is *always* loaded for `\CurrentFile` which usually is the same as `\CurrentFileUsed`. In the case of a file replacement, the `\CurrentFileUsed` holds the actual file loaded. In any case the file names are normalized so that the hooks work on the real file name, rather than what the user typed in.

`expl3`’s `\file_full_name:n` normalizes the file name (to factor out differences in the `.tex` extension), and then does a file lookup to take into account a possible path from `\l_file_search_path_seq` and `\input@path`. However only the file name and extension

are returned so that file hooks can refer to the file by their name only. The path to the file is returned in `\CurrentFilePath`.

```

161 \edef\reserved@a{%
162   \@expl@@@filehook@file@pop@assign@@nnnn
163   {\CurrentFilePathUsed}%
164   {\CurrentFileUsed}%
165   {\CurrentFilePath}%
166   {\CurrentFile}}%
167 \expandafter\@swaptwoargs\expandafter{\reserved@a}%

```

Before adding to the file list we need to make all (letter) characters catcode 11, because several packages use constructions like

```

\filename@parse{<filename>}
\ifx\filename@ext\@clsextension
...
\fi

```

and that doesn't work if `\filename@ext` is `\detokenized`. Making `\@clsextension` a string doesn't help much because some packages define their own `\<prefix>@someextension` with normal catcodes. This is not entirely correct because packages loaded (somehow) with catcode 12 alphabetic tokens (say, as the result of a `\string` or `\detokenize` command, or from a T<sub>E</sub>X string like `\jobname`) will have these character tokens incorrectly turned into letter tokens. This however is rare, so we'll go for the all-letters approach (grepping the packages in T<sub>E</sub>X Live didn't bring up any obvious candidate for breaking with this catcode change).

```

168 {\edef\reserved@a{\unqu@tefilef@und#1\@nil}%
169  \addtofilelist{\string@makeletter\reserved@a}%
170  \UseHook{file/before}%

```

The current file name is available in `\CurrentFile` so we use that in the specific hook.

```

171  \UseHook{file/\CurrentFile/before}%
172  \@input #1% <- trailing space comes from \@filef@und
173  }%

```

And here, `\CurrentFile` is restored (by `\@expl@@@filehook@file@pop@assign@@nnnn`) so we can use it once more.

```

174  \UseHook{file/\CurrentFile/after}%
175  \UseHook{file/after}}
176 \def\unqu@tefilef@und"#1" \@nil{#1}

```

Now declare the non-generic file hooks used above:

```

177 \NewHook{file/before}
178 \NewReversedHook{file/after}
179 \<latexrelease>\EndIncludeInRelease
180 \</2ekernel|latexrelease>

```

Now define `\InputIfFileExists` to input #1 if it seems to exist. Immediately prior to the input, #2 is executed. If the file #1 does not exist, execute '#3'.

## 2.5 Declaring a file substitution

```

202 <@=filehook>
203 </2ekernel>
204 <*2ekernel | latexrelease>
205 <latexrelease>\IncludeInRelease{2020/10/01}%
206 <latexrelease> {\_filehook_subst_add:nn}{Declaring file substitution}%
207 \ExplSyntaxOn

```

`\_filehook_subst_add:nn` `\_filehook_subst_add:nn` declares a file substitution by doing a (global) definition of the form `\def\@file-subst@{file}{replacement}`. The file names are properly sanitised, and normalized with the same treatment done for the file hooks. That is, a file replacement is declared by using the file name (and extension, if any) only, and the file path should not be given. If a file name is empty it is replaced by `.tex` (the empty csname is used to check that).

```

(End of definition for \declare@file@substitution and \undeclear@file@substitution. These functions are documented on page 1119.)

```

265 <@@=>

```

## 2.6 Selecting a file (\set@curr@file)

```

\set@curr@file Now we hook into \set@curr@file to resolve a possible file substitution, and add
\set@curr@file@nosearch \@expl@@@filehook@set@curr@file@@nNN at the end, after \@curr@file is set.

```

```

\curr@file A file name is built using \expandafter\string\csize{filename}\endcsname to
\curr@file@reqd avoid expanding utf8 active characters. The \csize expands the normalization machin-
ery and the routine to resolve a file substitution, returning a control sequence with the
same name as the file.

```

It happens that when `<filename>` is empty, the generated control sequence is `\csize\endcsname`, and doing `\string` on that results in the file `csizeendcsname.tex`. To guard against that we `\ifx`-compare the generated control sequence with the empty `csize`. To do so, `\csize\endcsname` has to be defined, otherwise it would be equal to `\relax` and we would have false positives. Here we define `\csize\endcsname` to expand to itself to avoid it matching the definition of some other control sequence.

```

266 </2ekernel>
267 <*2ekernel | latexrelease>
268 <latexrelease>\IncludeInRelease{2022/06/01}%
269 <latexrelease>          {\set@curr@file}{Setting current file name}%

281   \let\protect\string
282   \edef~{\string~}%
283   \expandafter\def\csize\expandafter\endcsname
284   \expandafter{\csize\endcsname}%

```

Two file names are set here: `\@curr@file@reqd` which is the file requested by the user, and `\@curr@file` which should be the same, except when we have a file substitution, in which case it holds the actual loaded file. `\@curr@file` is resolved first, to check if a substitution happens. If it doesn't, `\@expl@@@filehook@if@file@replaced@@TF` short-cuts and just copies `\@curr@file`, otherwise the full normalization procedure is executed.

At this stage the file name is parsed and normalized, but if the input doesn't have an extension, the default `.tex` is *not* added to `\@curr@file` because for applications other than `\input` (graphics, for example) the default extension may not be `.tex`. First check if the input has an extension, then if the input had no extension, call

\@expl@@@filehook@drop@extension@@N. In case of a file substitution, \@curr@file will have an extension.

## 2.7 Replacing a file and detecting loops

`\_filehook_resolve_file_subst:w`  
`\_filehook_normalize_file_name:w`  
`\_filehook_file_name_compose:nnn`

Start by sanitizing the file with `\_filehook_file_parse_full_name:nN` then do `\_filehook_file_subst_begin:nnn{\<path>}{\<name>}{\<ext>}`.

```

406 </2ekernel>
407 <*2ekernel | latexrelease>
408 <latexrelease>\IncludeInRelease{2020/10/01}%

```

```

409 <latexrelease>      {\_filehook_resolve_file_subst:w}{Replace files detect loops}%
410 \ExplSyntaxOn
411 \cs_new:Npn \_filehook_resolve_file_subst:w #1 \@nil
412   { \_filehook_file_parse_full_name:nN {#1} \_filehook_file_subst_begin:nnn }
413 \cs_new:Npn \_filehook_normalize_file_name:w #1 \@nil
414   { \_filehook_file_parse_full_name:nN {#1} \_filehook_file_name_compose:nnn }
415 \cs_new:Npn \_filehook_file_name_compose:nnn #1 #2 #3
416   { \tl_if_empty:nF {#1} { #1 / } #2#3 }

```

```

\_filehook_file_replaced
\_filehook_if_file_replaced:TF
\_filehook_clear_replacement_flag:

```

Since the file replacement is done expandably in a `\csname`, use a flag to remember if a substitution happened. We use this in `\setcurr@file` to short-circuit some of it in case no substitution happened (by far the most common case, so it's worth optimizing). The flag raised during the file substitution algorithm must be explicitly cleared after the `\_filehook_if_file_replaced:TF` conditional is no longer needed, otherwise further uses of `\_filehook_if_file_replaced:TF` will wrongly return true.

```

417 \flag_new:n { \_filehook_file_replaced }
418 \cs_new:Npn \_filehook_if_file_replaced:TF #1 #2
419   { \flag_if_raised:nTF { \_filehook_file_replaced } {#1} {#2} }
420 \cs_new_protected:Npn \_filehook_clear_replacement_flag:
421   { \flag_clear:n { \_filehook_file_replaced } }

```

```

\_filehook_file_subst_begin:nnn

```

First off, start by checking if the current file (`\langle name \rangle + \langle ext \rangle`) has a declared substitution. If not, then just put that as the name (including a possible `\langle path \rangle` in this case): this is the default case with no substitutions, so it's the first to be checked. The auxiliary `\_filehook_file_subst_tortoise_hare:nn` sees that there's no replacement for `#2#3` and does nothing else.

```

422 \cs_new:Npn \_filehook_file_subst_begin:nnn #1 #2 #3
423   {
424     \_filehook_file_subst_tortoise_hare:nn { #2#3 } { #2#3 }
425     { \_filehook_file_name_compose:nnn {#1} {#2} {#3} }
426   }
427 \ExplSyntaxOff
428 </2ekernel|latexrelease>
429 <latexrelease>\EndIncludeInRelease
430 <*2ekernel>

```

### 2.7.1 The Tortoise and Hare algorithm

```

\_filehook_file_subst_tortoise_hare:nn
\_filehook_file_subst_loop:NN
\_filehook_file_subst_loop:cc

```

If there is a substitution (`\langle true \rangle` in the first `\cs_if_exist:cTF` below), then first check if there is no substitution down the line: this should be the second most common case, of one file replaced by another. In that case just leave the substitution there and the job is done. If any substitution happens, then the `\flag \_filehook_file_replaced` is raised (conditionally, because checking if a flag is raised is much faster than raising it over and over again).

If, however there are more substitutions, then we need to check for a possible loop in the substitutions, which would otherwise put  $\text{\TeX}$  in an infinite loop if just an exhaustive expansion was used.

To detect a loop, the *Tortoise and Hare* algorithm is used. The name of the algorithm is an analogy to Aesop's fable, in which the Hare outruns a Tortoise. The two pointers here are the csnames which contains each file replacement, both of which start at the position zero, which is the file requested. In the inner part of the macro below, `\_filehook_file_subst_loop:cc` is called with `\@file-subst@<file>` and

`\@file-subst@\@file-subst@<file>`; that is, the substitution of `<file>` and the substitution of that substitution: the Tortoise walks one step while the Hare walks two.

Within `\__filehook_file_subst_loop:NN` the two substitutions are compared, and if they lead to the same file it means that there is a loop in the substitutions. If there's no loop, `\__filehook_file_subst_tortoise_hare:nn` is called again with the Tortoise at position 1 and the hare at 2. Again, the substitutions are checked ahead of the Hare pointer to check that it won't run too far; in case there is no loop in the declarations, eventually one of the `\cs_if_exist:cTF` below will go `<false>` and the algorithm will end; otherwise it will run until the Hare reaches the same spot as the tortoise and a loop is detected.

```

431 </2ekernel>
432 <*2ekernel|latexrelease>
433 <latexrelease>\IncludeInRelease{2020/10/01}%
434 <latexrelease> {\__filehook_file_subst_tortoise_hare:nn}{Tortoise and Hare}%
435 \ExplSyntaxOn
436 \cs_new:Npn \__filehook_file_subst_tortoise_hare:nn #1 #2 #3
437 {
438   \cs_if_exist:cTF { @file-subst@ #2 }
439   {
440     \flag_if_raised:nF { __filehook_file_replaced }
441     { \flag_raise:n { __filehook_file_replaced } }
442     \cs_if_exist:cTF { @file-subst@ \use:c { @file-subst@ #2 } }
443     {
444       \__filehook_file_subst_loop:cc
445       { @file-subst@ #1 }
446       { @file-subst@ \use:c { @file-subst@ #2 } }
447     }
448     { \use:c { @file-subst@ #2 } }
449   }
450   { #3 }
451 }

```

This is just an auxiliary to check if a loop was found, and continue the algorithm otherwise. If a loop is found, the `.tex` file is used as fallback and `\__filehook_file_subst_cycle_error:cN` is called to report the error.

```

452 \cs_new:Npn \__filehook_file_subst_loop:NN #1 #2
453 {
454   \token_if_eq_meaning:NNTF #1 #2
455   {
456     .tex
457     \__filehook_file_subst_cycle_error:cN { @file-subst@ #1 } #1
458   }
459   { \__filehook_file_subst_tortoise_hare:nn {#1} {#2} {#2} }
460 }
461 \cs_generate_variant:Nn \__filehook_file_subst_loop:NN { cc }

```

Showing this type of error expandably is tricky, as we have a very limited amount of characters to show and a potentially large list. As a work around, several errors are printed, each showing one step of the loop, until all the error messages combined show the loop.

```

462 \cs_new:Npn \__filehook_file_subst_cycle_error:NN #1 #2
463 {
464   \msg_expandable_error:nnff { latex2e } { file-cycle }

```

```

465     {#1} { \use:c { @file-subst@ #1 } }
466     \token_if_eq_meaning:NNF #1 #2
467     { \__filehook_file_subst_cycle_error:cN { @file-subst@ #1 } #2 }
468   }
469   \cs_generate_variant:Nn \__filehook_file_subst_cycle_error:NN { c }

```

And the error message:

```

470   \msg_new:nnn { latex2e } { file-cycle }
471   { File~loop!~#1~replaced~by~#2... }

```

(End of definition for `\__filehook_resolve_file_subst:w` and others.)

```

472   \ExplSyntaxOff
473   </2ekernel | latexrelease>
474   <latexrelease>\EndIncludeInRelease
475   <*2ekernel>
476   <@@=>

```

## 2.8 Preventing a package from loading

We support the use case of preventing a package from loading but not any other type of files (e.g., classes).

`\disable@package@load` defines `\@pkg-disable@<package>` to expand to some code #2 instead of loading the package.

```

\reenable@package@load
\@disable@packageload@do
477 </2ekernel>
478 <*2ekernel | latexrelease>
479 <latexrelease>\IncludeInRelease{2020/10/01}%
480 <latexrelease>          {\disable@package@load}{Disable packages}%
481 \def\disable@package@load#1#2{%
482   \global\@namedef{\@pkg-disable@#1.\@pkgextension}{#2}}

```

Here we check if a control sequence named `\@pkg-disable@<name>.sty` is defined, and if so don't use the package loading code #2, but use the replacement code stored in that control sequence, write something to the log, and then prevent `\@onefilewithoptions` from sanity-checking the requested package date (the `\expandafter` here triggers one in `\@onefilewithoptions` that ends a conditional there, and the `\@gobbletwo` removes the date checking code from the input stream).

```

483 \def\@disable@packageload@do#1#2{%
484   \@ifundefined{\@pkg-disable@#1}%
485     {#2}%
486     {\@nameuse{\@pkg-disable@#1}%
487       \@latex@info{Package '1' has been disabled.%
488         \MessageBreak Load request ignored}%
489       \expandafter\@gobbletwo}}

```

`\reenable@package@load` undefines `\@pkg-disable@<package>` to realow loading a package.

```

490 \def\reenable@package@load#1{%
491   \global\expandafter\let
492   \csname \@pkg-disable@#1.\@pkgextension \endcsname \@undefined}

```

```

493 </2ekernel | latexrelease>
494 <latexrelease>\EndIncludeInRelease
495 <latexrelease>\IncludeInRelease{0000/00/00}%
496 <latexrelease>      {\disable@package@load}{Disable packages}%
497 <latexrelease>
498 <latexrelease>\let\disable@package@load \@undefined
499 <latexrelease>\let\@disable@packageload@do\@undefined
500 <latexrelease>\let\reenable@package@load \@undefined
501 <latexrelease>\EndIncludeInRelease
502 <*2ekernel>

```

(End of definition for \disable@package@load, \reenable@package@load, and  
\@disable@packageload@do. These functions are documented on page 1119.)

## 2.9 High-level interfaces for L<sup>A</sup>T<sub>E</sub>X

None so far and the general feeling for now is that the hooks are enough. Packages like filehook, etc., may use them to set up their interfaces (samples are given below) but for the now the kernel will not provide any.

### 2.10 Internal commands needed elsewhere

Here we set up a few horrible (but consistent) L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub> names to allow for internal commands to be used outside this module (and in parts that still use L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub> syntax. We have to unset the @@ since we want double “at” sign in place of double underscores.

```

503 <@@= >
504 </2ekernel>
505 <*2ekernel | latexrelease>
506 <latexrelease>\IncludeInRelease{2020/10/01}%
507 <latexrelease>      {\@expl@@@filehook@if@no@extension@@nTF}{2e tmp interfaces}%
508 \ExplSyntaxOn

521 \cs_new_eq:NN \@expl@@@filehook@drop@extension@@N
522               \__filehook_drop_extension:N
523 \cs_new_eq:NN \@expl@@@filehook@file@push@@
524               \__filehook_file_push:
525 \cs_new_eq:NN \@expl@@@filehook@file@pop@@
526               \__filehook_file_pop:

```

```

527 \cs_new_eq:NN \@expl@@@filehook@file@pop@assign@@nnnn
528         \__filehook_file_pop_assign:nnnn
529 \ExplSyntaxOff

```

This one specifically has to be undefined because it is left over in the input stream from `\InputIfFileExists` and executed when `latexrelease` is loaded. It cannot be `\let` to `\undefined` otherwise it would error as well, so it is `\let` to `\relax` to be silently ignored when loading `\latexrelease`.

```

530 </2ekernel | latexrelease>
531 <latexrelease>\EndIncludeInRelease
532 <latexrelease>
533 <latexrelease>\IncludeInRelease{0000/00/00}%
534 <latexrelease>    {\@expl@@@filehook@if@no@extension@@nTF}{2e tmp interfaces}%
535 <latexrelease>\let\@expl@@@filehook@file@pop@@\relax
536 <latexrelease>\EndIncludeInRelease
537 <*2ekernel>

```

This ends the kernel code in this file.

```

538 </2ekernel>

```

### 3 A sample package for structuring the log output

```

539 <*structuredlog>
540 <@@=filehook>

541 \ProvidesExplPackage
542     {structuredlog}{\ltfilehookdate}{\ltfilehookversion}
543     {Structuring the TeX transcript file}

```

`\g_filehook_nesting_level_int` Stores the current package nesting level.

```

544 \int_new:N \g__filehook_nesting_level_int

```

Initialise the counter with the number of files in the `\@currnamestack` (the number of items divided by 3) minus one, because this package is skipped when printing to the log.

```

545 \int_gset:Nn \g__filehook_nesting_level_int
546     { ( \tl_count:N \@currnamestack ) / 3 - 1 }

```

*(End of definition for `\g__filehook_nesting_level_int`.)*

`\__filehook_log_file_record:n` This macro is responsible for increasing and decreasing the file nesting level, as well as printing to the log. The argument is either `STOPTART` or `STOP` and the action it takes on the nesting integer depends on that.

```

547 \cs_new_protected:Npn \__filehook_log_file_record:n #1
548     {
549         \str_if_eq:nnT {#1} {START} { \int_gincr:N \g__filehook_nesting_level_int }
550         \iow_term:x
551         {
552             \prg_replicate:nn { \g__filehook_nesting_level_int } { = } ~
553             ( LEVEL ~ \int_use:N \g__filehook_nesting_level_int \c_space_tl #1 ) ~
554             \CurrentFileUsed

```

If there was a file replacement, show that as well:

```

555     \str_if_eq:NNF \CurrentFileUsed \CurrentFile
556     { ~ ( \CurrentFile \c_space_tl requested ) }
557     \iow_newline:
558   }
559   \str_if_eq:nnT {#1} {STOP} { \int_gdecr:N \g__filehook_nesting_level_int }
560 }

```

Now just hook the macro above in the generic file/before...

```

561 \AddToHook{file/before}{ \__filehook_log_file_record:n { START } }
...and file/after hooks. We don't want to install the file/after hook immediately,
because that would mean it is the first time executed when the package finishes. We
therefore put the declaration inside \AddToHookNext so that it gets only installed when
we have left this package.

```

```

562 \AddToHookNext{file/after}
563 { \AddToHook{file/after}{ \__filehook_log_file_record:n { STOP } } }

```

(End of definition for \\_\_filehook\_log\_file\_record:n.)

```

564 <@@=
565 </structuredlog>

```

## 4 Package emulations

### 4.1 Package atveryend emulation

With the new hook management and the hooks in \enddocument all of atveryend is taken care of. We can make an emulation only here after the substitution functionality is available:

```

566 <*2ekernel>
567 \declare@file@substitution{atveryend.sty}{atveryend-ltx.sty}
568 </2ekernel>

```

Here is the package file we point to:

```

569 <*atveryend-ltx>
570 \ProvidesPackage{atveryend-ltx}
571 [2020/08/19 v1.0a
572 Emulation of the original atveryend package^^Jwith kernel methods]

```

Here are new definitions for its interfaces now pointing to the hooks in \enddocument

```

573 \newcommand\AfterLastShipout {\AddToHook{enddocument/afterlastpage}}
574 \newcommand\AtVeryEndDocument {\AddToHook{enddocument/afteraux}}

```

Next one is a bit of a fake, but the result should normally be as expected. If not, one needs to add a rule to sort the code chunks in enddocument/info.

```

575 \newcommand\AtEndAfterFileList{\AddToHook{enddocument/info}}
576 \newcommand\AtVeryVeryEnd {\AddToHook{enddocument/end}}

```

**\BeforeClearDocument** This one is the only one we don't implement or rather don't have a dedicated hook in the code.

```

577 \ExplSyntaxOn
578 \newcommand\BeforeClearDocument[1]
579 { \AtEndDocument{#1}
580   \atveryend@DEPRECATED{BeforeClearDocument \tl_to_str:n{#1}}
581 }

```

```

582 \cs_new:Npn\atveryend@DEPRECATED #1
583   {\iow_term:x{=====~DEPRECATED~USAGE~#1~=====}}
584 \ExplSyntaxOff

(End of definition for \BeforeClearDocument.)

585 \atveryend-ltx)

```

## File 53

# ltshipout.dtx

## 1 Introduction

The code provides an interface to the `\shipout` primitive of  $\text{\TeX}$  which is called when a finished pages is finally “shipped out” to the target output file, e.g., the `.dvi` or `.pdf` file. A good portion of the code is based on ideas by Heiko Oberdiek implemented in his packages `atbegshi` and `atenddvi` even though the interfaces are somewhat different.<sup>56</sup>

### 1.1 Overloading the `\shipout` primitive

---

**`\shipout`** With this implementation  $\text{\TeX}$ ’s shipout primitive is no longer available for direct use. Instead `\shipout` is running some (complicated) code that picks up the box to be shipped out regardless of how that is done, i.e., as a constructed `\vbox` or `\hbox` or as a box register.

It then stores it in a named box register. This box can then be manipulated through a set of hooks after which it is shipped out for real.

Each shipout that actually happens (i.e., where the material is not discarded for one or the other reason) is recorded and the total number is available in a readonly variable and in a  $\text{\LaTeX}$  counter.

---

**`\RawShipout`** This command implements a simplified shipout that bypasses the foreground and background hooks, e.g., only `shipout/firstpage` and `shipout/lastpage` are executed and the total shipout counters are incremented.

The command doesn’t use `\ShipoutBox` but its own private box register so that it can be used inside of shipout hooks to do some additional shipouts while already in the output routine with the current page being stored in `\ShipoutBox`. It does have access to `\ShipoutBox` if it is used in `shipout/before` (or `shipout/after`) and can use its content.

It is safe to use it in `shipout/before` or `shipout/after` but not necessarily in the other `shipout/...` hooks as they are intended for special processing.

---

<sup>56</sup>Heiko’s interfaces are emulated by the kernel code, if a document requests his packages, so older documents will continue to work.

---

<code>\ShipoutBox</code>	This box register is called <code>\ShipoutBox</code> (alternatively available via the L3 name <code>\l_shipout_box</code> ).
<code>\l_shipout_box</code>	

---

This box is a “local” box and assignments to it should be done only locally. Global assignments (as done by some packages with older code where this box is known as 255) may work but they are conceptually wrong and may result in errors under certain circumstances.

During the execution of `shipout/before` this box contains the accumulated material for the page, but not yet any material added by other shipout hooks. During execution of `shipout/after`, i.e., after the shipout has happened, the box also contains any background or foreground material.

Material from the hooks `shipout/firstpage` or `shipout/lastpage` is not included (but only used during the actual shipout) to facilitate reuse of the box data (e.g., `shipout/firstpage` material should never be added to a later page of the output).

---

<code>\l_shipout_box_ht_dim</code>
<code>\l_shipout_box_dp_dim</code>
<code>\l_shipout_box_wd_dim</code>
<code>\l_shipout_box_ht_plus_dp_dim</code>

---

The shipout box dimensions are available in the L3 registers `\l_shipout_box_ht_dim`, etc. (there are no L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub> names).<sup>57</sup> These variables can be used inside the hook code for `shipout/before`, `shipout/foreground` and `shipout/background` if needed.

## 1.2 Provided hooks

---

<code>shipout/before</code>	The code for <code>\shipout</code> offers a number of hooks into which packages (or the user) can add code to support different use cases. These are:
<code>shipout/after</code>	
<code>shipout/foreground</code>	
<code>shipout/background</code>	
<code>shipout/firstpage</code>	
<code>shipout/lastpage</code>	

---

**shipout/before** This hook is executed after the finished page has been stored in `\ShipoutBox` / `\l_shipout_box`. It can be used to alter that box content or to discard it completely (see `\DiscardShipoutBox` below).

You can use `\RawShipout` inside this hook for special use cases. It can make use of `\ShipoutBox` (which doesn’t yet include the background and foreground material).

**Note:** It is not possible (or say advisable) to try and use this hook to typeset material with the intention to return it to main vertical list, it will go wrong and give unexpected results in many cases—for starters it will appear after the current page not before or it will vanish or the vertical spacing will be wrong!

**shipout/background** This hook adds a picture environment into the background of the page with the (0,0) coordinate in the top-left corner using a `\unitlength` of 1pt.

It should therefore only receive `\put` commands or other commands suitable in a `picture` environment and the vertical coordinate values would normally be negative.

---

<sup>57</sup>Might need changing, but HO’s version as strings is not really helpful I think).

Technically this is implemented by adding a zero-sized `\hbox` as the very first item into the `\ShipoutBox` containing that `picture` environment. Thus the rest of the box content will overprint what ever is typeset by that hook.

**shipout/foreground** This hook adds a picture environment into the foreground of the page with the (0,0) coordinate in the top-left corner using a `\unitlength` of 1pt. Technically this is implemented by adding a zero-sized `\hbox` as the very last item into the `\ShipoutBox` and raising it up so that it still has its (0,0) point in the top-left corner. But being placed after the main box content it will be typeset later and thus overprints it (i.e., is in the foreground).

**shipout** This hook is executed after foreground and/or background material has been added, i.e., just in front of the actual shipout operation. Its purpose is to allow manipulation of the finalized box (stored in `\ShipoutBox`) with the extra material also in place (which is not yet the case in `shipout/before`).

It cannot be used to cancel the shipout operation via `\DiscardShipoutBox` (that has to happen in `shipout/before`, if desired!

**shipout/firstpage** The material from this hook is executed only once at the very beginning of the first output page that is shipped out (i.e., not discarded at the last minute). It should only contain `\special` or similar commands needed to direct post processors handling the .dvi or .pdf output.<sup>58</sup>

This hook is added to the very first page regardless of how it is shipped out (i.e., with `\shipout` or `\RawShipout`).

**shipout/lastpage** The corresponding hook to add `\specials` at the very end of the output file. It is only executed on the very last page of the output file — or rather on the page that `LATEX` believes is the last one. Again it is executed regardless of the shipout method.

It may not be possible for `LATEX` to correctly determine which page is the last one without several reruns. If this happens and the hook is non-empty then `LATEX` will add an extra page to place the material and also request a rerun to get the correct placement sorted out.

**shipout/after** This hook is executed after a shipout has happened. If the shipout box is discarded this hook is not looked at.

You can use `\RawShipout` inside this hook for special use cases and the main `\ShipoutBox` is still available at this point (but in contrast to `shipout/before` it now includes the background and foreground material).

**Note:** Just like `shipout/before` this hook is not meant to be used for adding typeset material back to the main vertical list—it might vanish or the vertical spacing will be wrong!

As mentioned above the hook `shipout/before` is executed first and can manipulate the prepared shipout box stored in `\ShipoutBox` or set things up for use in `\write` during the actual shipout. It is even run if there was a `\DiscardShipoutBox` request in the document.

The other hooks (except `shipout` and `shipout/after`) are added inside `hboxes` to the box being shipped out in the following order:

---

<sup>58</sup>In `LATEX 2ε` that was already existing, but implemented using a box register with the name `\@begindvibox`.

<code>shipout/firstpage</code>	only on the first page
<code>shipout/background</code>	
<code>&lt;boxed content of \ShipoutBox&gt;</code>	
<code>shipout/foreground</code>	
<code>shipout/lastpage</code>	only on the last page

If any of the hooks has no code then the corresponding box is added at that point.

Once the (page) box has got the above extra content it can again be manipulated using the `shipout` hook and then is shipped out for real.

Once the (page) box has been shipped out the `shipout/after` hook is called (while you are still inside the output routine). It is not called if the shipout box was discarded.

In a document that doesn't produce pages, e.g., only makes `\typeouts`, none of the hooks are ever executed (as there is no `\shipout`) not even the `shipout/lastpage` hook.

If `\RawShipout` is used instead of `\shipout` then only the hooks `shipout/firstpage` and `shipout/lastpage` are executed (on the first or last page), all others are bypassed.

### 1.3 Legacy L<sup>A</sup>T<sub>E</sub>X commands

<hr/>	<code>\AtBeginDvi</code>	<code>\AtBeginDvi {&lt;code&gt;}</code>
<hr/>	<code>\AtEndDvi</code>	<code>\AtBeginDvi</code> is the existing L <sup>A</sup> T <sub>E</sub> X 2 <sub>ε</sub> interface to fill the <code>shipout/firstpage</code> hook. This is not really a good name as it is not just supporting <code>.dvi</code> but also <code>.pdf</code> output or <code>.xdv</code> . <code>\AtEndDvi</code> is the counterpart that was not available in the kernel but only through the package <code>atenddvi</code> . It fills the <code>shipout/lastpage</code> hook.

Neither interface can set a code label but uses the current default label.

As these two wrappers have been available for a long time we continue offering them (but not enhancing them, e.g., by providing support for code labels).

For new code we strongly suggest using the high-level hook management commands directly instead of “randomly-named” wrappers. This will lead to code that is easier to understand and to maintain and it also allows you to set code labels if needed.

For this reason we do not provide any other “new” wrapper commands for the above hooks in the kernel, but only keep the existing ones for backward compatibility.

## 1.4 Special commands for use inside the hooks

---

<code>\DiscardShipoutBox</code> <code>\shipout_discard:</code>	<code>\AddToHookNext {shipout/before} {...\DiscardShipoutBox...}</code>
---	---

---

The `\DiscardShipoutBox` declaration (L3 name `\shipout_discard:`) requests that on the next shipout the page box is thrown away instead of being shipped to the `.dvi` or `.pdf` file.

Typical applications wouldn't do this unconditionally, but have some processing logic that decides to use or not to use the page.

Note that if this declaration is used directly in the document it may depend on the placement to which page it applies, given that  $\text{\LaTeX}$  output routine is called in an asynchronous manner! Thus normally one would use this only as part of the `shipout/before` code.

*Todo: Once we have a new mark mechanism available we can improve on that and make sure that the declaration applies to the page that contains it — not done (yet)*

`\DiscardShipoutBox` cannot be used in any of the `shipout/...` hooks other than `shipout/before`.

In the `atbegshi` package there are a number of additional commands for use inside the `shipout/before` hook. They should normally not be needed any more as one can instead simply add code to the hooks `shipout/before`, `shipout`, `shipout/background` or `shipout/foreground`.<sup>59</sup> If `atbegshi` gets loaded then those commands become available as public functions with their original names as given below.

## 1.5 Provided $\text{\LaTeX}$ callbacks

---

<code>pre_shipout_filter</code>	Under $\text{\LaTeX}$ the <code>pre_shipout_filter</code> Lua callback is provided which gets called directly after the <code>shipout</code> hook, immediately before the shipout primitive gets invoked. The signature is
---------------------------------	--

---

```
function(<node> head)
  return true
end
```

The `head` is the list node corresponding to the box to be shipped out. The return value should always be `true`.

---

<sup>59</sup>If that assumption turns out to be wrong it would be trivial to change them to public functions (right now they are private).

## 1.6 Information counters

---

<code>\ReadonlyShipoutCounter</code>	<code>\ifnum\ReadonlyShipoutCounter=...</code>
<code>\g_shipout_readonly_int</code>	<code>\int_use:N \g_shipout_readonly_int % expl3 usage</code>

---

This integer holds the number of pages shipped out up to now (including the one to be shipped out when inside the output routine). More precisely, it is incremented only after it is clear that a page will be shipped out, i.e., after the `shipout/before` hook (because that might discard the page)! In contrast `shipout/after` sees the incremented value.

Just like with the `page` counter its value is only accurate within the output routine. In the body of the document it may be off by one as the output routine is called asynchronously!

Also important: it *must not* be set, only read. There are no provisions to prevent that restriction, but if you manipulate it, chaos will be the result. To emphasize this fact it is not provided as a  $\text{\LaTeX}$  counter but as a  $\text{\TeX}$  counter (i.e., a command), so `\Alph{\ReadonlyShipoutCounter}` etc, would not work.

---

<code>totalpages</code>	<code>\arabic{totalpages}</code>
<code>\g_shipout_totalpages_int</code>	<code>\int_use:N \g_shipout_totalpage_int % expl3 usage</code>

---

In contrast to `\ReadonlyShipoutCounter`, the `totalpages` counter is a  $\text{\LaTeX}$  counter and incremented for each shipout attempt including those pages that are discarded for one or the other reason. Again `shipout/before` sees the counter before it is incremented. In contrast `shipout/after` sees the incremented value.

Furthermore, while it is incremented for each page, its value is never used by  $\text{\LaTeX}$ . It can therefore be freely reset or changed by user code, for example, to additionally count a number of pages that are not build by  $\text{\LaTeX}$  but are added in a later part of the process, e.g., cover pages or picture pages made externally.

Important: as this is a page-related counter its value is only reliable inside the output routine!

---

<code>\PreviousTotalPages</code>	<code>\PreviousTotalPages</code>
----------------------------------	----------------------------------

---

Command that expands to the number of total pages from the previous run. If there was no previous run or if used in the preamble it expands to 0. Note that this is a command and not a counter, so in order to display the number in, say, Roman numerals you have to assign its value to a counter and then use `\Roman` on that counter.

## 1.7 Debugging shipout code

---

<code>\DebugShipoutsOn</code>	<code>\DebugShipoutsOn</code>
<code>\DebugShipoutsOff</code>	
<code>\shipout_debug_on:</code>	Turn the debugging of shipout code on or off. This displays changes made to the shipout data structures.
<code>\shipout_debug_off:</code>	

---

*Todo: This needs some rationalizing and may not stay this way.*

## 2 Emulating commands from other packages

The packages in this section are no longer necessary, but as they are used by other packages, they are emulated when they are explicitly loaded with `\usepackage` or `\RequirePackage`.

Please note that the emulation only happens if the package is explicitly requested, i.e., the commands documented below are not automatically available in the L<sup>A</sup>T<sub>E</sub>X kernel! If you write a new package we suggest to use the appropriate kernel hooks directly instead of loading the emulation.

### 2.1 Emulating atbegshi

---

<code>\AtBeginShipoutUpperLeft</code>	<code>\AddToHook {shipout/before} {...\AtBeginShipoutUpperLeft{&lt;code&gt;}...}</code>
<code>\AtBeginShipoutUpperLeftForeground</code>	

---

This adds a `picture` environment into the background of the shipout box expecting `<code>` to contain `picture` commands. The same effect can be obtained by simply using kernel features as follows:

```
\AddToHook{shipout/background}{<code>}
```

There is one technical difference: if `\AtBeginShipoutUpperLeft` is used several times each invocation is put into its own box inside the shipout box whereas all `<code>` going into `shipout/background` ends up all in the same box in the order it is added or sorted based on the rules for the hook chunks.

`\AtBeginShipoutUpperLeftForeground` is similar with the difference that the `picture` environment is placed in the foreground. To model it with the kernel functions use the hook `shipout/foreground` instead.

---

<code>\AtBeginShipoutAddToBox</code>	<code>\AddToHook {shipout/before} {...\AtBeginShipoutAddToBox{&lt;code&gt;}...}</code>
<code>\AtBeginShipoutAddToBoxForeground</code>	

---

These work like `\AtBeginShipoutUpperLeft` and `\AtBeginShipoutUpperLeftForeground` with the difference that `<code>` is directly placed into an `\hbox` inside the shipout box and not surrounded by a `picture` environment.

To emulate them using `shipout/background` or `shipout/foreground` you may have to wrap `<code>` into a `\put` statement but if the code is not doing any typesetting just adding it to the hook should be sufficient.

---

<code>\AtBeginShipoutBox</code>	This is the name of the shipout box as <code>atbegshi</code> knows it.
---------------------------------	--

---

---

<code>\AtBeginShipoutOriginalShipout</code>
---

---

This is the name of the `\shipout` primitive as `atbegshi` knows it. This bypasses all the mechanisms set up by the L<sup>A</sup>T<sub>E</sub>X kernel and there are various scenarios in which it can therefore fail. It should only be used to run existing legacy `atbegshi` code but not in newly developed applications.

The kernel alternative is `\RawShipout` which is integrated with the L<sup>A</sup>T<sub>E</sub>X mechanisms and updates, for example, the `\ReadonlyShipoutCounter` counter. Please use `\RawShipout` for new code if you want to bypass the before, foreground and background hooks.

<hr/> <hr/>	<code>\AtBeginShipoutInit</code>	By default <code>atbegshi</code> delayed its action until <code>\begin{document}</code> . This command was forcing it in an earlier place. With the new concept it does nothing.
<hr/> <hr/>	<code>\AtBeginShipout</code> <code>\AtBeginShipoutNext</code>	<code>\AtBeginShipout{&lt;code&gt;} ≡ \AddToHook{shipout/before}{&lt;code&gt;}</code> <code>\AtBeginShipoutNext{&lt;code&gt;} ≡ \AddToHookNext{shipout/before}{&lt;code&gt;}</code> This is equivalent to filling the <code>shipout/before</code> hook by either using <code>\AddToHook</code> or <code>\AddToHookNext</code> , respectively.
<hr/> <hr/>	<code>\AtBeginShipoutFirst</code> <code>\AtBeginShipoutDiscard</code>	The <code>atbegshi</code> names for <code>\AtBeginDvi</code> and <code>\DiscardShipoutBox</code> .

## 2.2 Emulating everyshi

The `everyshi` package is providing commands to run arbitrary code just before the shipout starts. One point of difference: in the new shipout hooks the page is available as `\ShipoutBox` for inspection of change, one should not manipulate box 255 directly inside `shipout/before`, so old code doing this would change to use `\ShipoutBox` instead of 255 or `\@cclv`.

<hr/> <hr/>	<code>\EveryShipout</code>	<code>\EveryShipout{&lt;code&gt;} ≡ \AddToHook{shipout/before}{&lt;code&gt;}</code>
<hr/> <hr/>	<code>\AtNextShipout</code>	<code>\AtNextShipout{&lt;code&gt;} ≡ \AddToHookNext{shipout/before}{&lt;code&gt;}</code>

However, most use cases for `everyshi` are attempts to put some picture or text into the background or foreground of the page and that can be done today simply by using the `shipout/background` and `shipout/foreground` hooks without any need to coding.

## 2.3 Emulating atenddvi

The `atenddvi` package implemented only a single command: `\AtEndDvi` and that is now available out of the box so the emulation makes the package a no-op.

## 2.4 Emulating everypage

This package patched the original `\@begindvi` hook and replaced it with its own version. Its functionality is now covered by the hooks offered by the kernel so that there is no need for such patching any longer.

<hr/> <hr/>	<code>\AddEverypageHook</code>	<code>\AddEverypageHook{&lt;code&gt;} ≡</code> <code>\AddToHook{shipout/background}{\put(1in,-1in){&lt;code&gt;}}</code> <code>\AddEverypageHook</code> is adding something into the background of every page at a position of 1in to the right and 1in down from the top left corner of the page. By using the kernel hook directly you can put your material directly to the right place, i.e., use other coordinates in the <code>\put</code> statement above.
<hr/> <hr/>	<code>\AddThispageHook</code>	<code>\AddThispageHook{&lt;code&gt;} ≡</code> <code>\AddToHookNext{shipout/background}{\put(1in,-1in){&lt;code&gt;}}</code> The <code>\AddThispageHook</code> wrapper is similar but uses <code>\AddToHookNext</code> .

### 3 The Implementation

1 `<@@=shipout>`

At the moment the whole module rolls back in one go, but if we make any modifications in later releases this will then need splitting.

```
2 <*2ekernel | latexrelease>
3 <latexrelease>\IncludeInRelease{2020/10/01}%
4 <latexrelease>          {\shipout}{Hook management (shipout)}}%
5 \ExplSyntaxOn
```

#### 3.1 Debugging

`\g__shipout_debug_bool` Holds the current debugging state.

```
6 \bool_new:N \g__shipout_debug_bool
```

*(End of definition for `\g__shipout_debug_bool`.)*

`\shipout_debug_on:` Turns debugging on and off by redefining `\__shipout_debug:n`.

```
\shipout_debug_off:
\__shipout_debug:n
\__shipout_debug_gset:
7 \cs_new_eq:NN \__shipout_debug:n \use_none:n
8 \cs_new_protected:Npn \shipout_debug_on:
9   {
10     \bool_gset_true:N \g__shipout_debug_bool
11     \__shipout_debug_gset:
12   }
13 \cs_new_protected:Npn \shipout_debug_off:
14   {
15     \bool_gset_false:N \g__shipout_debug_bool
16     \__shipout_debug_gset:
17   }
18 \cs_new_protected:Npn \__shipout_debug_gset:
19   {
20     \cs_gset_protected:Npx \__shipout_debug:n ##1
21     { \bool_if:NT \g__shipout_debug_bool {##1} }
22   }
```

*(End of definition for `\shipout_debug_on:` and others. These functions are documented on page 1144.)*

`\ShipoutBox` The box filled with the page to be shipped out (both L3 and L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub> name).

```
\l_shipout_box
23 \box_new:N \l_shipout_box
24 \cs_set_eq:NN \ShipoutBox \l_shipout_box
```

*(End of definition for `\ShipoutBox` and `\l_shipout_box`. These functions are documented on page 1140.)*

`\l__shipout_raw_box` The `\RawShipout` gets its own box but it is internal as there is no hook manipulation for it.

```
25 \box_new:N \l__shipout_raw_box
```

*(End of definition for `\l__shipout_raw_box`.)*

`\__shipout_finalize_box:` For LuaTeX invoke the `pre_shipout_filter` callback.

```
26 \sys_if_engine luatex:TF
27 {
28   \newprotectedluacmd \__shipout_finalize_box:
29   \exp_args:Nx \everyjob {
30     \exp_not:V \everyjob
31     \exp_not:N \lua_now:n {
32       luatexbase.create_callback('pre_shipout_filter', 'list')
33       local~call, getbox, setbox = luatexbase.call_callback, tex.getbox, tex.setbox~
34       lua.get_functions_table()[\the \allocationnumber] = function()
35         local~head = getbox(\the \l_shipout_box)
36         local~result = call('pre_shipout_filter', head)
37         if~not (result == head) then~
38           setbox(\the \l_shipout_box, result~or~nil)
39         end~
40       end
41     }
42   }
43 } {
44   \cs_set_eq:NN \__shipout_finalize_box: \scan_stop:
45 }
```

*(End of definition for \\_\_shipout\_finalize\_box:.)*

`\__shipout_execute:` This is going to be the code run by `\shipout`. The code follows closely the ideas from `atbegshi`, so not documenting that here for now.

```
46 \cs_set_protected:Npn \__shipout_execute: {
47   \tl_set:Nx \l__shipout_group_level_tl
48   { \int_value:w \tex_currentgrouplevel:D }
49   \tex_afterassignment:D \__shipout_execute_test_level:
50   \tex_setbox:D \l_shipout_box
51 }
```

*(End of definition for \\_\_shipout\_execute:.)*

**\shipout** Overloading the `\shipout` primitive:

```
52 \cs_gset_eq:NN \shipout \__shipout_execute:
```

*(End of definition for \shipout. This function is documented on page 1139.)*

`\l__shipout_group_level_tl` Helper token list to record the group level at which `\__shipout_execute:` is encountered.

```
53 \tl_new:N \l__shipout_group_level_tl
```

*(End of definition for \l\_\_shipout\_group\_level\_tl.)*

`\__shipout_execute_test_level:` If the group level has changed then we are still constructing `\l_shipout_box` and to continue we need to wait until the current group has finished, hence the `\tex_aftergroup:D`.

```
54 \cs_new:Npn \__shipout_execute_test_level: {
55   \int_compare:nNnT
56   \l__shipout_group_level_tl < \tex_currentgrouplevel:D
57   \tex_aftergroup:D \__shipout_execute_cont:
58 }
```

*(End of definition for \\_\_shipout\_execute\_test\_level:.)*

`\__shipout_execute_cont:` This does the actual shipout running several hooks as part of it. The code for them is passed as argument #2 to #4 to `\__shipout_execute_main_cont:Nnnn`; the first argument is the box to be shipped out.

```

59 \cs_new:Npn \__shipout_execute_cont: {
60   \__shipout_execute_main_cont:Nnnn
61   \l_shipout_box
62   { \hook_use:n {shipout/before} }
63   { \hook_if_empty:nF {shipout/foreground}
64     { \__shipout_add_foreground_picture:n
65       { \hook_use:n {shipout/foreground} } } }

```

If the user hook for the background (`shipout/background`) has no code, there might still code in the kernel hook so we need to test for this too. We only test for the `\@kernel@before@shipout@background` though. If the `\@kernel@after@shipout@background` needs executing even if the user hook is empty then we can add another test (or the kernel could put something into the before hook).

```

66   \bool_lazy_and:nnF
67   { \hook_if_empty_p:n {shipout/background} }
68   { \tl_if_empty_p:N \@kernel@before@shipout@background }
69   { \__shipout_add_background_picture:n
70     { \@kernel@before@shipout@background
71       \hook_use:n {shipout/background}
72       \@kernel@after@shipout@background }
73   }
74 }
75 { \hook_use:n {shipout/after} }
76 }

```

(End of definition for `\__shipout_execute_cont:`.)

`\_shipout_execute_main_cont:Nnnn` When we have reached this point the shipout box has been processed and is available in `\l_shipout_box` and ready for real ship out (unless it gets discarded during the process).

The three arguments hold hook code that is executed just before the actual shipout (#1), within the shipout adding background and foreground material (#2) and after the shipout has happened (#3). These are passed as arguments because the same code without those hooks is also used when doing a “raw” shipout implemented by `\RawShipout`. The only hook that is always executed is that for the very last page, i.e., `shipout/lastpage`.

First we quickly check if it is void (can’t happen in the standard L<sup>A</sup>T<sub>E</sub>X output routine but `\shipout` might be called from a package that has some special processing logic). If it is void we aren’t shipping anything out and processing ends.<sup>60</sup>

```

77 \cs_new:Npn \__shipout_execute_main_cont:Nnnn #1#2#3#4 {
78   \box_if_empty:NTF #1
79   { \@latex@warning@no@line{ Ignoring~ void~ shipout~ box } }
80   {

```

Otherwise we assume that we will ship something and prepare for final adjustments (in particular setting the state of `\protect` while we are running the hook code). We also save the current `\protect` state to restore it later.

```

81 %       \bool_gset_false:N \g__shipout_discard_bool % setting this would disable
82                                     % \DiscardShipoutBox on doc-level

```

<sup>60</sup>In that case we don’t reset the deadcycles, that would be up to the OR processing logic to do.

```

83      \cs_set_eq:NN \__shipout_saved_protect: \protect
84      \set@typeset@protect

```

We also store the current shipout box dimension in registers, so that they can be used in the hook code.<sup>61</sup>

```

85      \__shipout_get_box_size:N #1

```

Then we execute the `shipout/before` hook (or nothing in case of `\RawShipout`).

```

86      #2

```

In `\g_shipout_totalpages_int` we count all shipout attempts so we increment that counter already here (the other one is incremented later when we know for sure that we do a `\shipout`).

We increment it after running the above hook so that the values for `\g_shipout_totalpages_int` and `\g_shipout_readonly_int` are in sync while the hook is executed (in the case that `totalpages` isn't manually altered or through discarding pages that is).

```

87      \int_gincr:N \g_shipout_totalpages_int

```

The above hook might contain code that requests the page to be discarded so we now test for it.

```

88      \bool_if:NTF \g__shipout_discard_bool
89      { \@latex@info@no@line{Completed~ page~ discarded}
90      \bool_gset_false:N \g__shipout_discard_bool

```

As we are discarding the page box and not shipping anything out, we need to do some house cleaning and reset T<sub>E</sub>X's deadcycles so that it doesn't complain about too many calls to the OR without any shipout.

```

91      \tex_deadcycles:D \c_zero_int

```

*Todo: In atbegshi the box was dropped but is that actually needed? Or the resetting of \protect to its kernel value?*

```

92 %      \group_begin:
93 %      \box_set_eq_drop:NN #1 #1
94 %      \group_end:
95 %      \cs_set_eq:NN \protect \exp_not:N
96      }

```

Even if there was no explicit request to discard the box it is possible that the code for the hook `shipout/before` has voided the box (by mistake or deliberately). We therefore test once more but this time make it a warning, because the best practice way is to use the request mechanism.

```

97      { \box_if_empty:NTF #1
98      { \@latex@warning@no@line { Ignoring~ void~ shipout~ box.
99      \MessageBreak The~ shipout~ box~ was~ voided~ by~ hook~ code }
100      }

```

Finally, if the box is still non-empty we are nearly ready to ship it out. First we increment the total page counter so that we can later test if we have reached the final page according to our available information.<sup>62</sup>

```

101      {

```

---

<sup>61</sup>This is not really necessary as the code could access them via `\box_ht:N`, etc., but it is perhaps convenient.

<sup>62</sup>Doing that earlier would be wrong because we might end up with the last page counted but discard and then we have no place to add the final objects into the output file.

```

102         \int_gincr:N \g_shipout_readonly_int
103         \__shipout_debug:n {
104             \typeout{Absolute~ page~ =~ \int_use:N \g_shipout_readonly_int
105                 \space (target:~ \@abspage@last)}
106         }

```

Then we store the box sizes again (as they may have changed) and then look at the hooks `shipout/foreground` and `shipout/background`. If either or both are non-empty we add a `picture` environment to the box (in the foreground and/or in the background) and execute the hook code inside that environment.

```

107         \__shipout_get_box_size:N #1

```

The first hook we run is the `shipout/firstpage` hook. This is only done once, then the `\__shipout_run_firstpage_hook:` command redefines itself to do nothing. If the hook contains `\specials` for integration at the top of the page they will be temporarily stored in a safe place and added later with `\__shipout_add_firstpage_specials:`.

```

108         \__shipout_run_firstpage_hook:

```

Run the hooks for background and foreground or, if this is called by `\RawShipout`, copy the box `\l__shipout_raw_box` to `\l_shipout_box` so that firstpage and lastpage material gets added if necessary (that is always done to `\l_shipout_box`).

```

109         #3

```

We then run `\__shipout_add_firstpage_specials:` that adds the content of the hook `shipout/firstpage` to the start of the first page (if non-empty). It is then redefined to do nothing on later pages.

```

110         \__shipout_add_firstpage_specials:

```

Then we check if we have to add the `shipout/lastpage` hook or the corresponding kernel hook because we have reached the last page. This test will be false for all but one (and hopefully the correct) page.

```

111         \int_compare:nNnT \@abspage@last = \g_shipout_readonly_int
112         { \bool_lazy_and:nnF
113             { \hook_if_empty_p:n {shipout/lastpage} }
114             { \tl_if_empty_p:N \@kernel@after@shipout@lastpage }
115             { \__shipout_debug:n { \typeout{Executing~ lastpage~ hook~
116                 on~ page~ \int_use:N \g_shipout_readonly_int } }
117                 \__shipout_add_foreground_box:n
118                 { \UseHook{shipout/lastpage}
119                     \@kernel@after@shipout@lastpage }

```

We record that we have handled the `shipout/lastpage` hook but only if we really did.

```

120         \bool_gset_true:N \g__shipout_lastpage_handled_bool
121     }
122 }

```

```

123         \hook_use:n {shipout}
124         \__shipout_finalize_box:

```

Finally we run the actual `TEX` primitive for shipout. As that will expand delayed `\write` statements inside the page in which protected commands should not expand we first change `\protect` to the appropriate definition for that case.

```

125         \cs_set_eq:NN \protect \exp_not:N
126         \tex_shipout:D \box_use:N \l_shipout_box

```

The `\l_shipout_box` may contain the firstpage material if this was the very first shipout. That makes it unsuitable for reuse in another shipout, so as a safety measure the next command resets `\l_shipout_box` to its earlier state if that is necessary. On later pages this is then a no-op.

```
127         \__shipout_drop_firstpage_specials:
```

The `shipout/after` hook (if in #4) needs to run with `\protected` commands again being executed, because that hook will “typeset” material added at the top of the next page.

```
128         \set@typeset@protect
129         #4
130     }
131 }
```

Restore the value of `\protect` in case `\shipout` is called outside of the output routine (where it is automatically restored because of the implicit group).

```
132     \cs_set_eq:NN \protect \__shipout_saved_protect:
133 }
134 }
```

*(End of definition for `\__shipout_execute_main_cont:Nnnn`.)*

`\__shipout_execute_raw:` This implements the “raw” shipout which bypasses the before, foreground, background and after hooks. It follows the same pattern than `\__shipout_execute_raw:` except that it finally calls `\__shipout_execute_main_cont:Nnnn` with three empty arguments. instead of the hook code.

```
135 \cs_set_protected:Npn \__shipout_execute_raw: {
136   \tl_set:Nx \l__shipout_group_level_tl
137   { \int_value:w \tex_currentgrouplevel:D }
138   \tex_afterassignment:D \__shipout_execute_test_level_raw:
139   \tex_setbox:D \l__shipout_raw_box
140 }

141 \cs_new:Npn \__shipout_execute_test_level_raw: {
142   \int_compare:nNnT
143   \l__shipout_group_level_tl < \tex_currentgrouplevel:D
144   \tex_aftergroup:D \__shipout_execute_nohooks_cont:
145 }
```

Well, not totally empty arguments, we add some debugging if we are actually doing a shipout.

```
146 \cs_new:Npn \__shipout_execute_nohooks_cont: {
147   \__shipout_execute_main_cont:Nnnn \l__shipout_raw_box
148   {} { \__shipout_debug:n{ \typeout{Doing~ raw~ shipout~ ...} }
149       \box_set_eq:NN \l_shipout_box \l__shipout_raw_box } {}
150 }
```

*(End of definition for `\__shipout_execute_raw:` and `\__shipout_execute_test_level_raw:.`)*

**`\RawShipout`** The interface name for raw shipout.

```
151 \cs_gset_eq:NN \RawShipout \__shipout_execute_raw:
```

*(End of definition for `\RawShipout`. This function is documented on page 1139.)*

`\__shipout_saved_protect:` Remember the current `\protect` state.

```
152 \cs_new_eq:NN \__shipout_saved_protect: \protect
```

(End of definition for `\_shipout_saved_protect:`.)

```

shipout/before  Declaring all hooks for the shipout code.
               shipout
               shipout/after
shipout/foreground \hook_new:n{shipout/after}
shipout/background \hook_new:n{shipout/foreground}
shipout/firstpage \hook_new:n{shipout/background}
shipout/lastpage  \hook_new:n{shipout/firstpage}
               \hook_new:n{shipout/lastpage}

```

(End of definition for `shipout/before` and others. These functions are documented on page 1140.)

```

\@kernel@after@shipout@lastpage And here are the internal kernel hooks going before or after the public ones where needed.
\@kernel@before@shipout@background
\@kernel@after@shipout@background
160 \let\@kernel@after@shipout@lastpage\@empty
161 \let\@kernel@before@shipout@background\@empty
162 \let\@kernel@after@shipout@background\@empty

```

(End of definition for `\@kernel@after@shipout@lastpage`, `\@kernel@before@shipout@background`, and `\@kernel@after@shipout@background`.)

```

\_shipout_run_firstpage_hook: There are three commands to handle the shipout/firstpage hook: \_shipout_run_
firstpage_hook:, \_shipout_add_firstpage_specials: and \_shipout_drop_
firstpage_specials:.

```

That hook is supposed to contain `\specials` and similar material to be placed at the very beginning of the output page and so it needs careful placing to avoid that anything else gets in front of it. And this means we have to wait with this until other hooks such as `shipout/background` have added their bits. It is also important that such `\specials` show up only on the very first page, so if this page gets saved before `\shipout` for later reuse, we have to make sure that they aren't in the saved version.

In addition the hook may also contain code to be executed “first”, e.g., visible from code in `shipout/background` and this conflicts with adding the `\specials` late.

Therefore the processing is split into different parts: `\_shipout_run_firstpage_hook:` is done early and checks if there is any material in the hook.

```

163 \cs_new:Npn \_shipout_run_firstpage_hook: {
164   \hook_if_empty:nTF {shipout/firstpage}

```

If not then we define the other two commands to do nothing.

```

165   {
166     \cs_gset_eq:NN \_shipout_add_firstpage_specials: \prg_do_nothing:
167     \cs_gset_eq:NN \_shipout_drop_firstpage_specials: \prg_do_nothing:
168   }

```

If there is material we execute inside a box, which means any `\special` will end up in that box and any other code is executed and can have side effects (as long as they are global).

```

169   {
170     \hbox_set:Nn \l__shipout_firstpage_box { \UseHook{shipout/firstpage} }
171   }

```

Once we are here we change the definition to do nothing next time and we also change the command used to implement `\AtBeginDvi` to become a warning and not add further material to a hook that is never used again.

```

172 \cs_gset_eq:NN \__shipout_run_firstpage_hook: \prg_do_nothing:
173 \cs_gset:Npn \__shipout_add_firstpage_material:Nn ##1 ##2 {
174   \@latex@warning{ First~ page~ is~ already~ shipped~ out,~ ignoring
175                 \MessageBreak \string##1 }
176 }
177 }

```

*(End of definition for `\__shipout_run_firstpage_hook:`.)*

`\__shipout_add_firstpage_specials:` The `\__shipout_add_firstpage_specials:` then adds the `\specials` stored in `\l__shipout_firstpage_box` to the page to be shipped out when the time is ready. Note that if there was no material in the `shipout/firstpage` hook then this command gets redefined to do nothing. But for most documents there is something, e.g., some PostScript header, or some metadata declaration, etc. so by default we assume there is something to do.

```

178 \cs_new:Npn \__shipout_add_firstpage_specials: {

```

First we make a copy of the `\l_shipout_box` that we can restore it later on.

```

179 \box_set_eq:NN \l__shipout_raw_box \l_shipout_box

```

Adding something to the beginning means adding it to the background as that layer is done first in the output.

```

180 \__shipout_add_background_box:n { \hbox_unpack_drop:N \l__shipout_firstpage_box }

```

After the actual shipout `\__shipout_drop_firstpage_specials:` is run to restore the earlier content of `\l_shipout_box` and then redefines itself again to do nothing.

As a final act we change the definition to do nothing next time.

```

181 \cs_gset_eq:NN \__shipout_add_firstpage_specials: \prg_do_nothing:
182 }

```

The `\__shipout_drop_firstpage_specials:` is run after the shipout has occurred but before the `shipout/afterpage` hook is executed. That is the point where we have to restore the `\ShipoutBox` to its state without the `shipout/firstpage` material.

```

183 \cs_new:Npn \__shipout_drop_firstpage_specials: {
184   \box_set_eq:NN \l_shipout_box \l__shipout_raw_box

```

If there was no such material then `\__shipout_run_firstpage_hook:` will have changed the definition to a no-op already. Otherwise this is what we do here.

```

185 \cs_gset_eq:NN \__shipout_drop_firstpage_specials: \prg_do_nothing:
186 }

```

*(End of definition for `\__shipout_add_firstpage_specials:` and `\__shipout_drop_firstpage_specials:`.)*

`\l__shipout_firstpage_box` The box to hold any firstpage `\specials`.

```

187 \box_new:N \l__shipout_firstpage_box

```

*(End of definition for `\l__shipout_firstpage_box`.)*

`\g__shipout_lastpage_handled_bool` A boolean to signal if we have already handled the `shipout/lastpage` hook.

```

188 \bool_new:N \g__shipout_lastpage_handled_bool

```

*(End of definition for `\g__shipout_lastpage_handled_bool`.)*

`\_shipout_add_firstpage_material:Nn` This command adds material to the `shipout/firstpage` hook. It is used in `\AtBeginDvi`, etc. The first argument is the command through which it is called. Initially this is ignored but once we are passed the first page it can be used to generate a warning message mentioning the right user command.

```

189 \cs_new:Npn \_shipout_add_firstpage_material:Nn #1#2 {
190   \AddToHook{shipout/firstpage}{#2}
191 }

```

(End of definition for `\_shipout_add_firstpage_material:Nn`.)

`\_shipout_get_box_size:N` Store the box dimensions in `dimen` registers.

*Todo: This could/should perhaps be generalized to set height depth and width given an arbitrary box.*

```

192 \cs_new:Npn \_shipout_get_box_size:N #1 {
193   \dim_set:Nn \l_shipout_box_ht_dim { \box_ht:N #1 }
194   \dim_set:Nn \l_shipout_box_dp_dim { \box_dp:N #1 }
195   \dim_set:Nn \l_shipout_box_wd_dim { \box_wd:N #1 }
196   \dim_set:Nn \l_shipout_box_ht_plus_dp_dim
197     { \l_shipout_box_ht_dim + \l_shipout_box_dp_dim }
198 }

```

(End of definition for `\_shipout_get_box_size:N`.)

`\l_shipout_box_ht_dim` And here are the variables set by `\_shipout_get_box_size:N`.

```

\l_shipout_box_dp_dim 199 \dim_new:N \l_shipout_box_ht_dim
\l_shipout_box_wd_dim 200 \dim_new:N \l_shipout_box_dp_dim
\l_shipout_box_ht_plus_dp_dim 201 \dim_new:N \l_shipout_box_wd_dim
202 \dim_new:N \l_shipout_box_ht_plus_dp_dim

```

(End of definition for `\l_shipout_box_ht_dim` and others. These functions are documented on page 1140.)

`\g_shipout_discard_bool` Indicate whether or not the current page box should be discarded

```

203 \bool_new:N \g_shipout_discard_bool

```

(End of definition for `\g_shipout_discard_bool`.)

`\l_shipout_tmp_box` We need a box for the background and foreground material and a token register to  
`\l_shipout_saved_badness_tl` remember badness settings as we disable them during the buildup below.

```

204 \box_new:N \l_shipout_tmp_box
205 \tl_new:N \l_shipout_saved_badness_tl

```

(End of definition for `\l_shipout_tmp_box` and `\l_shipout_saved_badness_tl`.)

`\_shipout_add_background_box:n` In standard L<sup>A</sup>T<sub>E</sub>X the shipout box is always a `\vbox` but here we allow for other usage as well, in case some package has its own output routine.

```

206 \cs_new:Npn \_shipout_add_background_box:n #1
207 { \_shipout_get_box_size:N \l_shipout_box

```

But we start testing for a vertical box as that should be the normal case.

```

208   \box_if_vertical:NTF \l_shipout_box
209   {

```

Save current values of `\vfuzz` and `\vbadness` then change them to allow box manipulations without warnings.

```

210      \tl_set:Nx \l__shipout_saved_badness_tl
211      { \vfuzz=\the\vfuzz\relax
212        \vbadness=\the\vbadness\relax }
213      \vfuzz=\c_max_dim
214      \vbadness=\c_max_int

```

Then we reconstruct `\l_shipout_box` ...

```

215      \vbox_set_to_ht:Nnn \l_shipout_box \l_shipout_box_ht_plus_dp_dim
216      {

```

... the material in #1 is placed into a horizontal box with zero dimensions.

```

217          \hbox_set:Nn \l__shipout_tmp_box
218          { \l__shipout_saved_badness_tl #1 }
219          \box_set_wd:Nn \l__shipout_tmp_box \c_zero_dim
220          \box_set_ht:Nn \l__shipout_tmp_box \c_zero_dim
221          \box_set_dp:Nn \l__shipout_tmp_box \c_zero_dim

```

The we typeset that box followed by whatever was in `\l_shipout_box` before (unpacked).

```

222          \skip_zero:N \baselineskip
223          \skip_zero:N \lineskip
224          \skip_zero:N \lineskiplimit
225          \box_use:N \l__shipout_tmp_box
226          \vbox_unpack:N \l_shipout_box

```

The `\kern` ensures that the box has no depth which is afterwards explicitly corrected.

```

227          \kern \c_zero_dim
228      }
229      \box_set_ht:Nn \l_shipout_box \l_shipout_box_ht_dim
230      \box_set_dp:Nn \l_shipout_box \l_shipout_box_dp_dim

```

*Todo: The whole boxing maneuver looks a bit like overkill to me, but for the moment I leave.*

```

231      \l__shipout_saved_badness_tl
232    }
233    {

```

A horizontal box is handled in a similar way. The last case would be a void box in which case we do nothing hence the missing F branch.

```

234      \box_if_horizontal:NT \l_shipout_box
235      {
236          \tl_set:Nx \l__shipout_saved_badness_tl
237          { \hfuzz=\the\hfuzz\relax
238            \hbadness=\the\hbadness\relax }
239          \hfuzz=\c_max_dim
240          \hbadness=\c_max_int
241          \hbox_set_to_wd:Nnn \l_shipout_box \l_shipout_box_wd_dim
242          {
243              \hbox_set:Nn \l__shipout_tmp_box
244              { \l__shipout_saved_badness_tl #1 }
245              \box_set_wd:Nn \l__shipout_tmp_box \c_zero_dim
246              \box_set_ht:Nn \l__shipout_tmp_box \c_zero_dim
247              \box_set_dp:Nn \l__shipout_tmp_box \c_zero_dim

```

```

248         \box_move_up:nn
249         \l_shipout_box_ht_dim

```

(End of definition for `\__shipout_add_foreground_box:n`.)

`\__shipout_init_page_origins:` Two constants holding the offset of the top-left with respect to the media box.  
`\c__shipout_horigin_tl` Setting the constants this way is courtesy of Bruno.  
`\c__shipout_vorigin_tl` We delay setting the constants to the last possible place as there might be updates in the preamble or even in the `begindocument` hook that affects their setup.

```

310 \cs_new:Npn \__shipout_init_page_origins: {
311   \tl_const:Nx \c__shipout_horigin_tl
312   {
313     \cs_if_exist_use:NTF \pdfvariable { horigin }
314     { \cs_if_exist_use:NF \pdfhorigin { 1in } }
315   }
316   \tl_const:Nx \c__shipout_vorigin_tl
317   {
318     \cs_if_exist_use:NTF \pdfvariable { vorigin }
319     { \cs_if_exist_use:NF \pdfvorigin { 1in } }
320   }

```

After the constants have been set there is no need to execute this command again, in fact it would raise an error, so we redefine it to do nothing.

```

321   \cs_gset_eq:NN \__shipout_init_page_origins: \prg_do_nothing:
322 }

```

(End of definition for `\__shipout_init_page_origins:`, `\c__shipout_horigin_tl`, and `\c__shipout_vorigin_tl`.)

`\__shipout_picture_overlay:n` Put the argument into a `picture` environment that doesn't take up any size and uses `1pt` for `\unitlength`.

*Todo: Could perhaps be generalized as it might be useful elsewhere. For now it is not.*

```

323 \cs_new:Npn \__shipout_picture_overlay:n #1 {

```

The very first time this is executed we have to initialize (and freeze) the origins.

```

324   \__shipout_init_page_origins:
325   \kern -\c__shipout_horigin_tl \scan_stop:
326   \vbox_to_zero:n {
327     \kern -\c__shipout_vorigin_tl \scan_stop:
328     \unitlength 1pt \scan_stop:

```

This mimics a simple zero-sized picture environment. The `\hss` is need in case there is horizontal material (without using `\put` with a positive width).

```

329     \hbox_set_to_wd:Nnn \l__shipout_tmp_box \c_zero_dim
330                     { \ignorespaces #1 \hss }
331     \box_set_ht:Nn \l__shipout_tmp_box \c_zero_dim
332     \box_set_dp:Nn \l__shipout_tmp_box \c_zero_dim
333     \box_use:N \l__shipout_tmp_box
334     \tex_vss:D
335   }
336 }

```

(End of definition for `\__shipout_picture_overlay:n`.)

`\__shipout_add_background_picture:n` Put a `picture` env in the background of the shipout box with its reference point in the top-left corner.

```

337 \cs_new:Npn \__shipout_add_background_picture:n #1 {
338   \__shipout_add_background_box:n { \__shipout_picture_overlay:n {#1} }
339 }

```

(End of definition for `\__shipout_add_background_picture:n`.)

`\__shipout_add_foreground_picture:n` Put a `picture` env in the foreground of the shipout box with its reference point in the top-left corner.

```

340 \cs_new:Npn \__shipout_add_foreground_picture:n #1 {
341   \__shipout_add_foreground_box:n { \__shipout_picture_overlay:n {#1} }
342 }

```

(End of definition for `\__shipout_add_foreground_picture:n`.)

**`\shipout_discard:`** Request that the next shipout box should be discarded. At the moment this is just setting a boolean, but we may want to augment this behavior that the position of the call is taken into account (in case  $\text{\LaTeX}$  looks ahead and is not using the position for on the next page).

```

343 \cs_new_protected:Npn \shipout_discard: {
344   \bool_gset_true:N \g__shipout_discard_bool
345 }

```

(End of definition for `\shipout_discard:`. This function is documented on page 1143.)

## 3.2 Handling the end of job hook

At the moment this is partly solved by using the existing hooks. But rather than putting the code into these hooks it should be moved to the right place directly as we shouldn't prefill hooks with material unless it needs to interact with other code.

**`\g_shipout_readonly_int`** **`\ReadonlyShipoutCounter`** We count every shipout activity that makes a page (but not those that are discarded) in order to know how many pages got produced.

```

346 \int_new:N \g_shipout_readonly_int

```

For  $\text{\LaTeX 2}_\epsilon$  it is available as a command (i.e., a  $\text{\TeX}$  counter only).

```

347 \cs_new_eq:NN \ReadonlyShipoutCounter \g_shipout_readonly_int

```

(End of definition for `\g_shipout_readonly_int` and `\ReadonlyShipoutCounter`. These functions are documented on page 1144.)

`\g_shipout_totalpages_int` We count every shipout attempt (even those that are discarded) in this counter. It is not used in the code but may get used in user code.

```
348 \int_new:N \g_shipout_totalpages_int
```

For L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub> this is offered as a L<sup>A</sup>T<sub>E</sub>X counter so can be easily typeset inside the output routine to display things like “\thepage/\thetotalpages”, etc.

```
349 \cs_new_eq:NN \c@totalpages \g_shipout_totalpages_int
```

```
350 \cs_new:Npn \thetotalpages { \arabic{totalpages} }
```

(End of definition for `\g_shipout_totalpages_int` and `\c@totalpages`. These functions are documented on page 1144.)

`\@abspage@last` In `\@abspage@last` record the number of pages from the last run. This is written to the .aux and this way made available to the next run. In case there is no .aux file or the statement is missing from it we initialize it with the largest possible number in T<sub>E</sub>X. We use this as the default because then we are inserting the `shipout/lastpage` on the last page (or after the last page) but not on page 1 for a multipage document.

```
351 \xdef\@abspage@last{\number\maxdimen}
```

(End of definition for `\@abspage@last`.)

`\enddocument` Instead of using the hooks `enddocument` and `enddocument/afterlastpage` we add this code to private kernel hooks to be 100% sure when it is executed and to avoid cluttering the hooks with data that is always there.

Inside `\enddocument` there is a `\clearpage`. Just before that we execute this code here. There is a good chance that we are on the last page. Therefore, if we don’t know the value from the last run, we assume that the current page is the right one. So we set `\@abspage@last` and as a result the next shipout will run the `shipout/lastpage` code. Of course, if there are floats that still need a placement this guess will be wrong but then rerunning the document will give us the correct value next time around.

```
\@kernel@after@enddocument 352 \g@addto@macro \@kernel@after@enddocument {
353   \int_compare:nNtT \@abspage@last = \maxdimen
354   {
```

We use L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub> coding as `\@abspage@last` is not an L<sub>3</sub> name.

```
355   \xdef\@abspage@last{ \int_eval:n {\g_shipout_readonly_int + 1} }
356   }
357 }
```

After the last page has been shipped out, we force further `\write` calls to be always `\immediate` because we aren’t going to ship out any more pages. This goes before the `enddocument/afterlastpage` hook because that may contain such `\write` commands.

```
358 \g@addto@macro \@kernel@before@enddocument@afterlastpage {
359   \__shipout_force_immediate_writes:
360   % This is also the point where \__tag_lastpage_label: could be executed
361   % instead of going into enddocument/afterlastpage
362 }
```

Once the `\clearpage` has done its work inside `\enddocument` we know for sure how many pages this document has, so we record that in the .aux file for the next run.

```
363 \g@addto@macro \@kernel@after@enddocument@afterlastpage {
```

There is one special case: If no output is produced then there is no point in a) recording the number as 0 will never match the page number of a real page and b) adding an extra page to ran the `shipout/lastpage` is pointless as well (as it would remain forever). So we test for this and run the code only if there have been pages.

```
364 \int_compare:nNnF \g_shipout_readonly_int = 0
365 {
```

This ends up in the `.aux` so we use  $\LaTeX 2_\epsilon$  names here.

*Todo: This needs an interface for `\nofiles` in `expl3`, doesn't at the moment!*

```
366 \if@files
367 \iow_now:Nx \@auxout {
368 \gdef\string\@abspage@last {\int_use:N \g_shipout_readonly_int}}
369 \fi
```

But we may have guessed wrongly earlier and have run it too early or we still have to run the `shipout/lastpage` even though there is no page to place it into. If that is the case we make a trivial extra page and put it there. This temporary page will then vanish again on the next run but helps to keep pdf viewers happy. In either case we should put out an appropriate “rerun” warning.

```
370 \bool_if:NTF \g__shipout_lastpage_handled_bool
371 {
```

If the hook was already executed, we have to test if that total shipouts match the shipouts from last run (because that corresponds to the page it was executed). If not we output a warning.

```
372 \int_compare:nNnF \@abspage@last = \g_shipout_readonly_int
373 {
374 \@latex@warning@no@line{Hook~ 'shipout/lastpage'~ executed~
375 on~ wrong~ page~ (\@abspage@last\space not~
376 \int_use:N \g_shipout_readonly_int).\MessageBreak
377 Rerun~ to~ correct~ this}%
378 }
379 }
380 {
```

If the hook was not run, we need to add an extra page and place it there. However, making this extra page in case the hook is actually empty would be forcing a rerun without any reason, so we check that condition and also check if `\@kernel@after@shipout@lastpage` contains any code. If both are empty we omit the page generation.

```
381 \bool_lazy_and:nnF
382 { \hook_if_empty_p:n {shipout/lastpage} }
383 { \tl_if_empty_p:N \@kernel@after@shipout@lastpage }
384 {
385 \global\advance\c@page\@ne
386 \tex_shipout:D\vbox to\textheight
387 {
388 \hbox:n { \UseHook{shipout/lastpage}
389 \@kernel@after@shipout@lastpage }
390 }
```

This extra page could be totally empty except for the hook content, but to help the user understanding why it is there we put some text into it.

```
390 \__shipout_excuse_extra_page:
391 \null
392 }
```

At this point we also signal to L<sup>A</sup>T<sub>E</sub>X's endgame that a rerun is necessary so that an appropriate message can be shown on the terminal. We do this by simply defining a command used as a flag and tested in `\enddocument`.

```

393             \cs_gset_eq:NN \@extra@page@added \relax
394         }
395     }
396 }
397 }

```

*(End of definition for \enddocument and others.)*

```

__shipout_excuse_extra_page: Say mea culpa ...
398 \cs_new:Npn __shipout_excuse_extra_page: {
399     \vfil
400     \begin{center}
401         \bfseries Temporary~ page!
402     \end{center}
403     \LaTeX{}~ was~ unable~ to~ guess~ the~ total~ number~ of~ pages~
404     correctly.~ ~ As~ there~ was~ some~ unprocessed~ data~ that~
405     should~ have~ been~ added~ to~ the~ final~ page~ this~ extra~

411     \vfil
412 }

```

*(End of definition for \_\_shipout\_excuse\_extra\_page:.)*

**\PreviousTotalPages** In the preamble before the aux file was read `\PreviousTotalPages` is always zero.

```

\@kernel@before@begindocument 413 \def\PreviousTotalPages{0}

In the aux file there should be an update for \@abspage@last recording the number of
pages from the previous run. If not that macro holds the value of \maxdimen. So we test
for it and update \PreviousTotalPages if there was a real value. This should happen
just before the begindocument hook is executed so that the value can be used inside that
hook.

414 \g@addto@macro\@kernel@before@begindocument
415     {\ifnum\@abspage@last<\maxdimen
416         \xdef\PreviousTotalPages{\@abspage@last}\fi}

```

*(End of definition for \PreviousTotalPages and \@kernel@before@begindocument. These functions are documented on page 1144.)*

## 4 Legacy L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub> interfaces

**\DiscardShipoutBox** Request that the next shipout box is to be discarded.

```

417 \cs_new_eq:NN \DiscardShipoutBox \shipout_discard:

```

*(End of definition for \DiscardShipoutBox. This function is documented on page 1143.)*

`\AtBeginDvi` If we roll forward from an earlier kernel `\AtBeginDvi` is defined so we better not use `\cs_new_protected:Npn` here.

```
418 \cs_set_protected:Npn \AtBeginDvi
419 { \__shipout_add_firstpage_material:Nn \AtBeginDvi }
```

(End of definition for `\AtBeginDvi`. This function is documented on page 1142.)

`\DebugShipoutsOn`  
`\DebugShipoutsOff`

```
420 \cs_new_eq:NN \DebugShipoutsOn \shipout_debug_on:
421 \cs_new_eq:NN \DebugShipoutsOff \shipout_debug_off:
```

(End of definition for `\DebugShipoutsOn` and `\DebugShipoutsOff`. These functions are documented on page 1144.)

## 5 Internal commands needed elsewhere

These internal commands use double and triple @ signs so we need to stop getting them translated to the module name.

```
422 <@@=>
```

```
\expl@@@shipout@add@firstpage@material@@Nn
\expl@@@shipout@add@background@box@@n
\expl@@@shipout@add@foreground@box@@n
\expl@@@shipout@add@background@picture@@n
\expl@@@shipout@add@foreground@picture@@n
```

Some internals needed elsewhere.

```
423 \cs_set_eq:NN \expl@@@shipout@add@firstpage@material@@Nn
424 \__shipout_add_firstpage_material:Nn
425 \cs_set_eq:NN \expl@@@shipout@add@background@box@@n
426 \__shipout_add_background_box:n
427 \cs_set_eq:NN \expl@@@shipout@add@foreground@box@@n
428 \__shipout_add_foreground_box:n
429 \cs_set_eq:NN \expl@@@shipout@add@background@picture@@n
430 \__shipout_add_background_picture:n
431 \cs_set_eq:NN \expl@@@shipout@add@foreground@picture@@n
432 \__shipout_add_foreground_picture:n
```

(End of definition for `\expl@@@shipout@add@firstpage@material@@Nn` and others.)

```
433 \ExplSyntaxOff
434 </2ekernel | latexrelease>
435 <latexrelease>\EndIncludeInRelease
```

Rolling back here doesn't undefine the interface commands as they may be used in packages without rollback functionality. So we just make them do nothing which may or may not work depending on the code usage.

```
436 <latexrelease>\IncludeInRelease{0000/00/00}%
437 <latexrelease> { \shipout } { Hook management (shipout) } %
438 <latexrelease>
```

If we roll forward then `\tex_shipout:D` may not be defined in which case `\shipout` does have it original definition and so we must not `\let` it to something else which is `\relax`!

```
439 <latexrelease>\ifcsname tex_shipout:D\endcsname
440 <latexrelease>\expandafter\let\expandafter\shipout
441 <latexrelease> \csname tex_shipout:D\endcsname
442 <latexrelease>\fi
```

*(End of definition for \\_shipout\_force\_immediate\_writes:.)*

## 6 Package emulation for compatibility

### 6.1 Package atenddvi emulation

**\AtEndDvi** This package has only one public command, so simulating it is easy and actually sensible to provide as part of the kernel.

```
495 </2ekernel>
496 <*2ekernel | latexrelease>
497 <latexrelease>\IncludeInRelease{2020/10/01}%
498 <latexrelease> {\AtEndDvi}{atenddvi emulation}%
499 \ExplSyntaxOn
500 \cs_new_protected:Npn \AtEndDvi #1 {\AddToHook{shipout/lastpage}{#1}}
501 \ExplSyntaxOff
```

As the package is integrate we prevent loading (no need to roll that back):

```
502 \disable@package@load{atenddvi}
503 {\PackageWarning{atenddvi}
504 {Functionality of this package is already\MessageBreak
505 provided by LaTeX.\MessageBreak\MessageBreak
506 It is there no longer necessary to load it\MessageBreak
507 and you can safely remove it.\MessageBreak
508 Found on}}
509 </2ekernel | latexrelease>
```

```

510 <latexrelease>\EndIncludeInRelease
511 <latexrelease>\IncludeInRelease{0000/00/00}%
512 <latexrelease>{\AtEndDvi}{atendddvi emulation}%
513 <latexrelease>\let \AtEndDvi \@undefined
514 <latexrelease>\EndIncludeInRelease
515 <*2ekernel>

(End of definition for \AtEndDvi. This function is documented on page 1142.)

516 </2ekernel>

```

## 6.2 Package atbegshi emulation

```

517 <*atbegshi-ltx>
518 \ProvidesPackage{atbegshi-ltx}
519 [2021/01/10 v1.0c
520 Emulation of the original atbegshi^^Jpackage with kernel methods]

```

**\AtBeginShipoutBox**

```

521 \let \AtBeginShipoutBox \ShipoutBox

(End of definition for \AtBeginShipoutBox. This function is documented on page 1145.)

```

**\AtBeginShipoutInit** Compatibility only, we aren't delaying ...

```

522 \let \AtBeginShipoutInit \@empty

(End of definition for \AtBeginShipoutInit. This function is documented on page 1146.)

```

**\AtBeginShipout**  
**\AtBeginShipoutNext**

Filling hooks

```

523 \protected\long\def\AtBeginShipout #1{\AddToHook{shipout/before}{#1}}
524 \protected\long\def\AtBeginShipoutNext #1{\AddToHookNext{shipout/before}{#1}}

(End of definition for \AtBeginShipout and \AtBeginShipoutNext. These functions are documented
on page 1146.)

```

**\AtBeginShipoutFirst**

Slightly more complex as we need to know the name of the command under which the shipout/firstpage hook is filled.

```

(End of definition for \AtBeginShipoutFirst. This function is documented on page 1146.)

```

**\AtBeginShipoutDiscard**

Just a different name.

```

527 \let \AtBeginShipoutDiscard \DiscardShipoutBox

(End of definition for \AtBeginShipoutDiscard. This function is documented on page 1146.)

```

**\AtBeginShipoutAddToBox**  
**\AtBeginShipoutAddToBoxForeground**  
**\AtBeginShipoutUpperLeft**  
**\AtBeginShipoutUpperLeftForeground**

We don't expose them.

```

528 \let \AtBeginShipoutAddToBox
529 \@expl@@@shipout@add@background@box@@n
530 \let \AtBeginShipoutAddToBoxForeground
531 \@expl@@@shipout@add@foreground@box@@n

532 \let \AtBeginShipoutUpperLeft
533 \@expl@@@shipout@add@background@picture@@n
534 \let \AtBeginShipoutUpperLeftForeground
535 \@expl@@@shipout@add@foreground@picture@@n

```

(End of definition for `\AtBeginShipoutAddToBox` and others. These functions are documented on page 1145.)

`\AtBeginShipoutOriginalShipout` This offers the raw `\shipout` primitive of the engine. A page shipped out with this is not counted by `\ReadonlyShipoutCounter` counter and thus the mechanism to place `\specials` at the very end of the output might fail, etc. It should therefore not be used in new applications but is only provided to allow running legacy code. For new code use the commands provided by the kernel instead.

```
536 \ExplSyntaxOn
537 \cs_new_eq:NN \AtBeginShipoutOriginalShipout \tex_shipout:D
```

(End of definition for `\AtBeginShipoutOriginalShipout`. This function is documented on page 1145.)

`\ShipoutBoxHeight` `\ShipoutBoxWidth` `\ShipoutBoxDepth` This is somewhat different from the original in `atbegshi` where `\ShipoutBoxHeight` etc. only holds the `\the\ht<box>` value. This may have some implications in some use cases and if that is a problem then it might need changing.

```
538 \cs_new:Npn \ShipoutBoxHeight { \dim_use:N \l_shipout_box_ht_dim }
539 \cs_new:Npn \ShipoutBoxDepth { \dim_use:N \l_shipout_box_dp_dim }
540 \cs_new:Npn \ShipoutBoxWidth { \dim_use:N \l_shipout_box_wd_dim }
541 \ExplSyntaxOff
```

(End of definition for `\ShipoutBoxHeight`, `\ShipoutBoxWidth`, and `\ShipoutBoxDepth`.)

```
542 </atbegshi-ltx>
```

If the package is requested we substitute the one above:

```
543 <*2ekernel>
544 \declare@file@substitution{atbegshi.sty}{atbegshi-ltx.sty}
545 </2ekernel>
```

### 6.3 Package **everyshi** emulation

This is now directly handled in that package so emulation is not necessary any more.

Rather important :-)

```
546 <@@=>
```

*                               *
*                               *
*****
```

#### PAGE LAYOUT PARAMETERS

`\topmargin` : Extra space added to top of page.  
`@twoside` : boolean. T if two-sided printing  
`\oddsidemargin` : IF `@twoside = T`  
THEN extra space added to left of odd-numbered  
pages.  
ELSE extra space added to left of all pages.  
`\evensidemargin` : IF `@twoside = T`  
THEN extra space added to left of even-numbered  
pages.  
`\headheight` : height of head  
`\headsep` : separation between head and text  
`\footskip` : distance separation between baseline of last  
line of text and baseline of foot.  
Note difference between `\footSKIP` and `\headSEP`.  
`\textheight` : height of text on page, excluding head and foot  
`\textwidth` : width of printing on page  
`\columnsep` : IF `@twocolumn = T`  
THEN width of space between columns  
`\columnseprule` : IF `@twocolumn = T`  
THEN width of rule between columns (0 if none).  
`\columnwidth` : IF `@twocolumn = T`  
THEN  $(\text{\textwidth} - \text{\columnsep})/2$   
ELSE `\textwidth`  
It is set by the `\twocolumn` and  
`\onecolumn` commands.  
`\@textbottom` : Command executed at bottom of vbox holding text of  
page (including figures). The `\raggedbottom`  
command almost \let's this to `\vfil` (actually sets  
it to `\vskip \z@ plus.0001fil`).  
Should have depth 0pt.

`\@texttop` : Command executed at top of vbox holding text of page (including figures). Used by letter style; can also be used to produce centered pages. Let to `\relax` by `\raggedbottom` and `\flushbottom`.

Page layout must initialize `\@colht` and `\@colroom` to `\textheight`.

#### PAGE STYLE PARAMETERS:

`\floatsep` : Space left between floats.  
`\textfloatsep` : Space between last top float or first bottom float and the text.  
`\topfigrule` : Command to place rule (or whatever) between floats at top of page and text. Executed in inner vertical mode right before the `\textfloatsep` skip separating the floats from the text. Must occupy zero vertical space. (See `\footnoterule`.)  
`\botfigrule` : Same as `\topfigrule`, but put after the `\textfloatsep` skip separating text from the floats at bottom of page.  
`\intextsep` : Space left on top and bottom of an in-text float.  
`\dblfloatsep` : Space between double-column floats.  
`\dbltextfloatsep` : Space between top double-column floats and text.  
`\dblfigrule` : Similar to `\topfigrule`, but for double-column floats.  
`\@fptop` : Glue to go at top of float column – must be 0pt + stretch  
`\@fpsep` : Glue to go between floats in a float column.  
`\@fpbot` : Glue to go at bottom of float column  
– must be 0pt + stretch  
`\@dblfpsep`, `\@dblfpbot` : Analogous for double-column float page in two-column format.

FOOTNOTES: As in PLAIN, footnotes use `\insert\footins`.

#### PAGE LAYOUT SWITCHES AND MACROS

`@twocolumn` : Boolean. T if two columns per page globally.

#### PAGE STYLE MACROS AND SWITCHES

`\@oddhead` : IF `@twoside = T`  
THEN macro to generate head of odd-numbered pages.  
ELSE macro to generate head of all pages.  
`\@evenhead` : IF `@twoside = T`  
THEN macro to generate head of even-numbered

pages.

`\@oddfoot` : IF `@twoside = T`  
                   THEN macro to generate foot of odd-numbered  
                   pages.  
                   ELSE macro to generate foot of all pages.

`\@evenfoot` : IF `@twoside = T`  
                   THEN macro to generate foot of even-numbered  
                   pages.

`@specialpage` : boolean. T if current page is to have a special  
                   format.

`\@specialstyle` : If its value is `foo` then  
                   IF `@specialpage = T`  
                   THEN the command `\ps@foo` is executed to  
                   temporarily reset the page style parameters  
                   before composing the current page.  
                   This command should execute only `\def`'s and  
                   `\edef`'s, making only local definitions.

## FLOAT PLACEMENT PARAMETERS

The following parameters are set by the macro `\@floatplacement`.  
 When `\@floatplacement` is called,

`\@colht` is the height of the page or column being built. I.e.:

- \* For single-column page it equals `\textheight`.
- \* For double-column page it equals `\textheight - height`  
 of double-column floats on page.

Note that some are set globally and some locally:

`\@topnum` :=G Maximum number of floats allowed on the top of a  
             column.

`\@toproom` :=G Maximum amount of top of column devoted to floats—  
             excluding `\textfloatsep` separation below the floats  
             and `\floatsep` separation between them. For  
             two-column output, should be computed as a function  
             of `\@colht`.

`\@botnum`, `\@botroom`  
             : Analogous to above.

`\@colnum` :=G Maximum number of floats allowed in a column,  
             including in-text floats.

`\@textmin` :=L Minimum amount of text (excluding footnotes) that  
             must appear on a text page.  
             %% 27 Sep 85 : made local to  
             %% `\@addtocurcol` and `\@addtonextcol`  
             It is now also used locally in processing double  
             floats.

`\@fpmin` :=L Minimum height of floats in a float column.

The macro `\dblfloatplacement` sets the following parameters.

`\dbltopnum` :=G Maximum number of double-column floats allowed at  
             the top of a two-column page.

`\dbltoproom` :=G Maximum height of double-column floats allowed at

top of two-column page.

`\@fpm` :=L Minimum height of floats in a float column.

It should also perform the following local assignments where necessary – i.e., where the new value differs from the old one:

`\@fptop` :=L `\@dblftop`

`\@fpsep` :=L `\@dblfpsep`

`\@fpbot` :=L `\@dblfpbot`

## OUTPUT ROUTINE VARIABLES

`\@colht` : The total height of the current column. In single column style, it equals `\textheight`. In two-column style, it is `\textheight` minus the height of the double-column floats on the current page. MUST BE INITIALIZED TO `\textheight`.

`\@colroom` : The height available in the current column for text and footnotes. It equals `\@colht` minus the height of all floats committed to the top and bottom of the current column.

`\@textfloatsheight` : The total height of in-text floats on the current page.

`\footins` : Footnote insertion number.

`\@maxdepth` : Saved value of TeX's `\maxdepth`. Must be set when any routine sets `\maxdepth`.

## CALLING THE OUTPUT ROUTINE

The output routine is called either by TeX's normal page-breaking mechanism, or by a macro putting a penalty  $<$  or  $= -10000$  in the output list. In the latter case, the penalty indicates why the output routine was called, using the following code.

penalty	reason
-10000	<code>\pagebreak</code> <code>\newpage</code>
-10001	<code>\clearpage</code> ( <code>\penalty -10000 \vbox{}</code> <code>\penalty -10001</code> )
-10002	float insertion, called from horizontal mode
-10003	float insertion, called from vertical mode.
-10004	float insertion.

Note: A float or marginpar puts the following sequence in the output list:

- (i) a penalty of -10004,
- (ii) a null `\vbox`
- (iii) a penalty of -10002 or -10003.

This solves two special problems:

1. If the float comes right after a `\newpage` or `\clearpage`, then the first penalty is ignored, but the second one invokes the output routine.
2. If there is a split footnote on the page, the second 'page' puts out the rest of the footnote.

## THE OUTPUT ROUTINE

---

### FUNCTIONS USED IN THE OUTPUT ROUTINE:

`\@outputpage` : Produces an output page with the contents of box `\@outputbox` as the text part.  
 Also sets `\@colht :=G \textheight`.  
 The page style is determined as follows.  
   IF `@thispagestyle = true`  
     THEN use `\thispagestyle` style  
     ELSE use ordinary page style.

`\@tryfcolumn\FLIST` : Tries to form a float column composed of floats from `\FLIST` (if nonempty) with the following parameters:  
   `\@colht` : height of box  
   `\@fpmin` : minimum height of floats in the box  
   `\@fpsep` : interfloat space  
   `\@fptop` : glue at top of box  
   `\@fpbot` : glue at bottom of box.  
 If it succeeds, then it does the following:  
   \* `\@outputbox :=L` the composed float box.  
   \* `@fcolmade :=G true`  
   \* `\FLIST :=G \FLIST` - floats put in box  
   \* `\@freelist :=G \@freelist +` floats put in box  
 If it fails, then:  
   \* `@fcolmade :=G false`

NOTE: BIT MUST BE A SINGLE TOKEN!

`\@makefcolumn \FLIST` : Same as `\@tryfcolumn` except that it fails to make a float column only if `\FLIST` is empty. Otherwise, it makes a float column containing at least the first box in `\FLIST`, disregarding `\@fpmin`.

`\@startcolumn` :  
 Calls `\@tryfcolumn\@deferlist`. If `\@tryfcolumn` returns with (globally set) `@fcolmade = false`, then:  
   \* Globally sets `\@toplist` and `\@botlist` to floats from `\@deferlist` to go at top and bottom of column, deleting them from `\@deferlist`. It does this using `\@colht` as the total height, the page style parameters `\@floatsep` and `\@textfloatsep`, and the float placement parameters `\@topnum`, `\@toproom`, `\@botnum`, `\@botroom`, `\@colnum` and `\textfraction`.

\* Globally sets `\@colroom` to `\@colht` minus the height of the added floats.

`\@startdblcolumn` :

Calls `\@tryfcolumn\@dbldeferlist{8}`. If `\@tryfcolumn` returns with (globally set) `@fcolmade = false`, then:

- \* Globally sets `\@dbltoplist` to floats from `\@dbldeferlist` to go at top and bottom of column, deleting them from `\@dbldeferlist`. It does this using `\textheight` as the total height, and the parameters `\@dblfloatsep`, etc.
- \* Globally sets `\@colht` to `\textheight` minus the height of the added floats.

`\@combinefloats` : Combines the text from box

`\@outputbox` with the floats from `\@toplist` and `\@botlist`, putting the new box in `\@outputbox`. It uses `\floatsep` and `\textfloatsep` for the appropriate separations. It puts the elements of `\@toplist` and `\@botlist` onto `\@freelist`, and makes those lists null.

`\@makecol` : Makes the contents of `\box255` plus the accumulated footnotes, plus the floats in `\@toplist` and `\@botlist`, into a single column of height `\@colht` (unless the page height has been locally changed), which it puts into box `\@outputbox`. It puts boxes in `\@midlist` back onto `\@freelist` and restores `\maxdepth`.

`\@opcol` : Outputs a column whose text is in box `\@outputbox`

If `@twocolumn = false`, then it calls `\@outputpage`, sets `\@colht :=G \textheight`, and calls `\@floatplacement`.

If `@twocolumn = true`, then:

If `@firstcolumn = true`, then it puts box `\@outputbox` into `\@leftcolumn` and sets `@firstcolumn :=G false`.

If `@firstcolumn = false`, then it puts out the current two-column page, any possible two-column float pages, and determines `\@dbltoplist` for the next page.

## USER COMMANDS THAT CALL OR AFFECT THE OUTPUT

### ROUTINE

---

`\newpage == BEGIN \par\vfil\penalty -10000 END`

`\clearpage == BEGIN \newpage  
\write -1{} % Part of hack to make sure no`

```

\hbox{} % \write's get lost.
\penalty -10001
END

\cleardoublepage == BEGIN \clearpage
                    if @twoside = true and c@page is even
                    then \hbox{} \newpage fi
END

\twocolumn[BOX] : starts a new page, changing to twocolumn setting
and puts BOX in a parbox of width \textwidth across the top.
Useful for full-width titles for double-column pages.
SURPRISE: The stretch from \dbltextfloatsep will be inserted
between the BOX and the top of the two columns.

```

## FLOAT-HANDLING MECHANISMS

---

The float environment obtains an insertion number B from the `\@freelist` (see below for a description of list manipulation), puts the float into box B and sets `\count B` to a FLOAT SPECIFIER. For a normal (not double-column) float, it then causes a page break in one of the following two ways:

- In outer hmode: `\vadjust{\penalty -10002}`
- In vmode : `\penalty -10003`.

For a double-column float, it puts B onto the `\@dbldeferlist`. The float specifier has two components:

- \* A PLACEMENT SPECIFICATION, describing where the float may be placed.
- \* A TYPE, which is a power of two—e.g., figures might be type 1 floats, tables type 2 floats, programs type 4 floats, etc.

The float specifier is encoded as follows, where bit 0 is the least significant bit.

Bit	Meaning
0	1 iff the float may go where it appears in the text.
1	1 iff the float may go on the top of a page.
2	1 iff the float may go on the bottom of a page.
3	1 iff the float may go on a float page.
4	1 unless the PLACEMENT includes a !
5	1 iff a type 1 float
6	1 iff a type 2 float
etc.	

A negative float specifier is used to indicate a marginal note.

## MACROS AND DATA STRUCTURES FOR PROCESSING FLOATS

---

A FLOAT LIST consisting of the floats in boxes `\boxa ... \boxN` has the form:

`\@elt \boxa ... \@elt \boxN`

where `\boxI` is defined by

`\newinsert\boxI`

Normally, `\@elt` is `\let` to `\relax`. A test can be performed on the entire float list by locally `\def`'ing `\@elt` appropriately and executing the list.

This is a lot more efficient than looping through the list.

The following macros are used for manipulating float lists.

```
\@next \CS \LIST {NONEMPTY}{EMPTY} == %% NOTE: ASSUME \@elt
= \relax
  BEGIN  assume that \LIST == \@elt \B1 ... \@elt \Bn
        if n = 0
        then  EMPTY
        else  \CS      :=L \B1
              \LIST :=G \@elt \B2 ... \@elt \Bn
              NONEMPTY
        fi
  END
```

`\@bitor\NUM\LIST` : Globally sets switch `@test` to the disjunction for all `I` of bit `log2 \NUM` of the float specifiers of all the floats in `\LIST`.  
 I.e., `@test` is set to true iff there is at least one float in `\LIST` having bit `log2 \NUM` of its float specifier equal to 1.

Note: `log2 [(\count I)/32]` is the bit number corresponding to the type of float `I`. To see if there is any float in `\LIST` having the same type as float `I`, you run `\@bitor` with  
`\NUM = [(\count I)/32] * 32`.

```
\@bitor\NUM\LIST ==
  BEGIN
    @test :=G false
    { \@elt \CTR == if \NUM <> 0 then
                      if \count\CTR / \NUM is odd
                      then @test := true      fi fi
    \LIST
  }
  END
```

`\@cons\LIST\NUM` : Globally sets `\LIST := \LIST * \@elt \NUM`

```

\@cons\LIST\NUM ==
  BEGIN { \@elt == \relax
    \LIST :=G \LIST \@elt \NUM
  }

```

## BOX LISTS FOR FLOAT-PLACEMENT ALGORITHMS

```

\@freelist      : List of empty boxes for placing new floats.
\@toplist       : List of floats to go at top of current column.
\@midlist       : List of floats in middle of current column.
\@botlist       : List of floats to go at bottom of current column.
\@deferlist     : List of floats to go after current column.
\@dbltoplist    : List of double-col. floats to go at top of current
                  page.
\@dbldeferlist  : List of double-column floats to go on subsequent
                  pages.

```

## FLOAT-PLACEMENT ALGORITHMS

```

\@addtobot : Tries to put insert \@currbox on \@botlist.
             Called only when:
               * \ht BOX < \@colroom
               * type of \@currbox not on \@deferlist
               * \@colnum > 0
               * @insert = false
             If it succeeds, then:
               * sets @insert true
               * decrements \@botroom by \ht BOX
               * decrements \@botnum and \@colnum by 1
               * decrements \@colroom by \ht BOX + either \floatsep
                 or \textfloatsep, as appropriate.
               * sets \maxdepth to 0pt      % <- as of 2025/06/01
                                           %      no longer the case

\@addtotoporbot : Tries to put insert \@currbox on \@toplist or
                  \@botlist.
                  Called only under same conditions as \@addtobot.
                  If it succeeds, then:
                    * sets @insert true
                    * decrements \@toproom or \@botroom by \ht BOX
                    * decrements \@colnum and either \@topnum or
                      \@botnum by 1
                    * decrements \@colroom by \ht BOX + \floatsep
                      or \textfloatsep, as appropriate.

\@addtocurcol : Tries to add \@currbox to current column, setting
                 @insert true if it succeeds, false otherwise.
                 It will add \@currbox to top only if bit 0 of

```

\count \@currbox is 0, and to the bottom only if  
bit 0 = 0 or an earlier float of the same type is  
put on the bottom.  
If the float is put in the text, then  
\penalty\interlinepenalty is put  
right after the float, before the following \vskip,  
and \outputpenalty :=L 0.

\@addtonextcol : Tries to add \@currbox to the next column, setting  
@insert true if it succeeds, false otherwise.

\@addtodblcol : Tries to add \@currbox to the next double-column page,  
adding it to \@dbltoplist if it succeeds and  
\@dbldeferlist if it fails.

```
\@addmarginpar ==
BEGIN
  if \@currlist nonempty
    then remove \@marbox from \@currlist
      add \@marbox and \@currbox to \@freelist
      %% NOTE: \@currbox = left box
    else LaTeX error: ? %% shouldn't happen
  fi
  \@tempcnta := 1      %% 1 = right, -1 = left

44 \gdef\@deferlist{}
45 \gdef\@dbltoplist{}

```

The new algorithm stores page wide floats together with column floats in a single \@deferlist list. We keep \@dbldeferlist initialised as empty so that packages that are testing for deferred floats can use the same code for old or new float handling.

```
46 \gdef\@dbldeferlist{}
```

### 1.2.2 Page layout parameters

```

47 \newdimen\topmargin
48 \newdimen\oddsidemargin
49 \newdimen\evensidemargin
50 \let\themargin=\oddsidemargin
51 \newdimen\headheight
52 \newdimen\headsep
53 \newdimen\footskip
54 \newdimen\textheight
55 \newdimen\textwidth
56 \newdimen\columnwidth
57 \newdimen\columnsep
58 \newdimen\columnseprule
59 \newdimen\marginparwidth
60 \newdimen\marginparsep
61 \newdimen\marginparpush

```

**\AtBeginDvi** We use a box register in which to put stuff that must appear before anything else in the .dvi file.

**\@begindvibox** The stuff in the box should not add any typeset material to the page when it is unboxed.

This interface is no longer used. Instead a new one is inside `ltshipout.dtx`. We only keep the box in case some old code refers to it directly (or we do some rollback).

```

62 \newbox\@begindvibox
63 %\DeclareRobustCommand \AtBeginDvi [1]{%
64 % \global \setbox \@begindvibox
65 % \vbox{\unvbox \@begindvibox #1}%
66 %}

```

*(End of definition for \AtBeginDvi and \@begindvibox. These functions are documented on page 1142.)*

`\@maxdepth` This is not the right place to set this; it needs to be set in a class/style file when `\maxdepth` is set.

Also, many settings to `\maxdepth` should be to `\@maxdepth`, probably?

```
67 \newdimen\@maxdepth
68 \@maxdepth = \maxdepth
```

*(End of definition for \@maxdepth.)*

`\paperheight` New `\paper...` registers.

```
\paperwidth 69 \newdimen\paperheight
70 \newdimen\paperwidth
```

*(End of definition for \paperheight and \paperwidth.)*

`\stockheight` New `\stock...` registers.

```
\stockwidth 71 \newdimen\stockheight
72 \newdimen\stockwidth
```

*(End of definition for \stockheight and \stockwidth.)*

`\if@insert` Local switches first:

```
\if@fcolmade 73 \newif \if@insert
```

`\if@specialpage` These should definitely be global:

```
\if@firstcolumn 74 \newif \if@fcolmade
\if@twocolumn 75 \newif \if@specialpage \@specialpagefalse
\if@twoside
```

`\if@reversemargin` These should be global but are not always set globally in other files.

```
\if@mparswitch 76 \newif \if@firstcolumn \@firstcolumntrue
\col@number 77 \newif \if@twocolumn \@twocolumnfalse
```

Not sure about these: two questions. Should things which must apply to a whole document be local or global (they probably should be ‘preamble only’ commands)? Are these three such things?

```
78 \newif \if@twoside \@twosidefalse
79 \newif \if@reversemargin \@reversemarginfalse
80 \newif \if@mparswitch \@mparswitchfalse
```

This counter has been imported from ‘multicol’.

```
81 \newcount \col@number
82 \col@number \@ne
```

*(End of definition for \if@insert and others.)*

### 1.2.3 Internal registers

```

83 \newcount\@topnum
84 \newdimen\@toproom
85 \newcount\@dbltopnum
86 \newdimen\@dbltoproom
87 \newcount\@botnum
88 \newdimen\@botroom
89 \newcount\@colnum
90 \newdimen\@textmin
91 \newdimen\@fpmin
92 \newdimen\@colht
93 \newdimen\@colroom
94 \newdimen\@pageht
95 \newdimen\@pagedp
96 \newdimen\@mparbottom \@mparbottom\z@
97 \newcount\@currtype
98 \newbox\@outputbox
99 \newbox\@leftcolumn
100 \newbox\@holdpg
101 \def\@thehead{\@oddhead} % initialization
102 \def\@thefoot{\@oddfoot}

```

### 1.2.4 Page break commands

**\clearpage** The tests at the beginning are an experimental attempt to avoid a completely empty page after a `\twocolumn[...]`. This prevents the text from the argument vanishing into a float box, never to be seen again. We hope that it does not produce wrong formatting in other cases.

```

103 \def\clearpage{%
104   \ifvmode
105     \ifnum \@dbltopnum =\m@ne
106       \ifdim \pagetotal <\topskip
107         \hbox{}%
108       \fi
109     \fi
110   \fi
111   \newpage

```

After the above `\newpage` there may be some still unwritten `\write`'s issued in the output routine and we need to make sure that they are not lost when `\@docclearpage` produces float pages. Therefore the following trick is applied: We add a harmless `\write` followed by an empty `\vbox` and then call the output routine again through a special penalty. That triggers `\@docclearpage` in the OR which splits off a zero-sized chunk from box 255 (which should go up to, but not including, the `\vbox`), then `\unvbox` that (which should contain any `\write`'s, and then throw away the rest of 255 (which should just contain the `\vbox`). That explains the strange `\write-1{}`: that statement introduces a necessary breakpoint so that the split is done before the `\vbox`. If it would not be there and *there are no real \write's*, then the split would grab the whole of 255 and so would put the `\vbox` back on the page and we would end with an extra page only containing that empty `\vbox`.

Deep breath—the above is my (Frank's) attempt of a slightly longer version of Leslie's cryptic comment earlier in the file that this `\write` is “part of a hack to make sure that no `\write`'s are lost”.

This `\write` needs to be non-immediate even if we are supposedly already past the last page because it has to end up on the page sent to the output routine if for some reason that happens.

```

112 \@@write\m@ne{}\%
113 \vbox{}\%
114 \penalty -\@Mi
115 }

116 \let\@@write\write

```

*(End of definition for \clearpage.)*

`\cleardoublepage`

```

117 \def\cleardoublepage{\clearpage\if@twoside \ifodd\c@page\else
118 \hbox{}\newpage\if@twocolumn\hbox{}\newpage\fi\fi\fi}
119 </2ekernel>

```

*(End of definition for \cleardoublepage.)*

`\onecolumn`

```

120 <*2ekernel | fltrace>
121 \def\onecolumn{%
122 \clearpage
123 \global\columnwidth\textwidth
124 \global\hsize\columnwidth
125 \global\linewidth\columnwidth
126 \global\@twocolumnfalse
127 \col@number \@ne
128 \@floatplacement}

```

*(End of definition for \onecolumn.)*

`\newpage` The two checks at the beginning ensure that an item label or run-in section title immediately before a `\newpage` get printed on the correct page, the one before the page break.

All three tests are largely to make error processing more robust; that is why they all reset the flags explicitly, even when it would appear that this would be done by a `\leavevmode`.

```

129 </2ekernel | fltrace>
130 <latexrelease>\IncludeInRelease{2025/06/01}%
131 <latexrelease> \{\newpage\}{Check depth of page}%
132 <*2ekernel | latexrelease | fltrace>
133 \def \newpage {%
134 \if@noskipsec
135 \ifx \@nodocument\relax
136 \leavevmode
137 \global \@noskipsecfalse
138 \fi
139 \fi
140 \if@inlabel
141 \leavevmode
142 \global \@inlabelfalse
143 \fi
144 \if@nobreak \@nobreakfalse \everypar{}\fi

```

The `\vfil` at the end of the macro before the break penalty will normally result in the page being run short, even with `\flushbottom` in effect (in contrast to the behavior of `\pagebreak`). However, if there is some explicit stretch on the page, say, a `\vfill`, it has the undesired side-effect, that the last line will not align at its baseline if it contains characters going below the baseline, as the value of `\prevdepth` is no longer taken into account by T<sub>E</sub>X. So we have to back up by that amount (or by `\maxdepth` if it is really huge), to mimic the normal behavior without the `\newpage`.

In 2017 this was fixed by doing the backing-up here. However, the problem with that is that if the page contains footnotes the `\skip\ý` is measured from the baseline of the last line and not (as on all other pages) from the bottom of the last line. One can argue that measuring from the baseline is better, but if that is done it should be done everywhere not just on some pages.

Thus this backing up should only happen when there are no footnotes. The problem is that, at the point when `\newpage` is called, it is not known whether or not there are footnotes; that is only determined in the output routine. We have therefore moved this code to the newly introduced output routine sockets.

An explicit `\par` token is required so that after environments like lists `\par` is reset to its standard meaning and does not suppress indentation on the next page.

```

145 \par
146 % \ifdim\prevdepth>\z@
147 % \vskip -%
148 % \ifdim\prevdepth>\maxdepth
149 % \maxdepth
150 % \else
151 % \prevdepth
152 % \fi
153 % \fi
154 \vfil
155 \penalty -\@M}
156 </2ekernel | latexrelease | fltrace>
157 <latexrelease>\EndIncludeInRelease

158 <latexrelease>\IncludeInRelease{2017/04/15}%
159 <latexrelease> \newpage{Check depth of page}%
160 <latexrelease>\def \newpage {%
161 <latexrelease> \if@noskipsec
162 <latexrelease> \ifx \@nodocument\relax
163 <latexrelease> \leavevmode
164 <latexrelease> \global \@noskipsecfalse
165 <latexrelease> \fi
166 <latexrelease> \fi
167 <latexrelease> \if@inlabel
168 <latexrelease> \leavevmode
169 <latexrelease> \global \@inlabelfalse

174 <latexrelease> \vskip -%
175 <latexrelease> \ifdim\prevdepth>\maxdepth
176 <latexrelease> \maxdepth
177 <latexrelease> \else
178 <latexrelease> \prevdepth

```

```

179 <latexrelease> \fi
180 <latexrelease> \fi
181 <latexrelease> \vfil
182 <latexrelease> \penalty -\@M}

183 <latexrelease>\EndIncludeInRelease
184 <latexrelease>\IncludeInRelease{0000/00/00}%
185 <latexrelease> \newpage}{Check depth of page}%
186 <latexrelease>\def \newpage {%
187 <latexrelease> \if@noskipsec
188 <latexrelease> \ifx \@nodocument\relax
189 <latexrelease> \leavevmode
190 <latexrelease> \global \@noskipsecfalse
191 <latexrelease> \fi
192 <latexrelease> \fi
193 <latexrelease> \if@inlabel
194 <latexrelease> \leavevmode
195 <latexrelease> \global \@inlabelfalse
196 <latexrelease> \fi
197 <latexrelease> \if@nobreak \@nobreakfalse \everypar{}\fi
198 <latexrelease> \par
199 <latexrelease> \vfil
200 <latexrelease> \penalty -\@M}
201 <latexrelease>\EndIncludeInRelease
202 <*2ekernel|fltrace>

```

*(End of definition for \newpage.)*

`\@emptycol` It may be better to use an invisible rule rather than an empty box here.

```
203 \def \@emptycol {\vbox{}\penalty -\@M}
```

*(End of definition for \@emptycol.)*

`\twocolumn` There are several bug fixes to the two-column stuff here.  
`\@topnewpage`

```

204 \def \twocolumn {%
205   \clearpage
206   \global\columnwidth\textwidth
207   \global\advance\columnwidth-\columnsep
208   \global\divide\columnwidth\tw@
209   \global\hsize\columnwidth
210   \global\linewidth\columnwidth
211   \global\@twocolumntrue
212   \global\@firstcolumntrue
213   \col@number \tw@

```

There is no reason to put a `\@dblfloatplacement` here since `\@topnewpage` ignores these settings. The `\@floatplacement` is needed in case this comes after some changes.

```

214   \ifnextchar [\@topnewpage\@floatplacement
215 }

```

Note that here, getting a box from the freelist can assume success since this comes just after a `\clearpage`.

```

216 \long\def \@topnewpage [#1]{%
217   \@nodocument
218   \@next\@currbox\@freelist{}\}%

```

```

219 \global \setbox\@currbox
220 \color@vbox
221 \normalcolor
222 \vbox {%
223 \hsize\textwidth
224 \@parboxrestore
225 \col@number \@ne
226 #1%
227 \vskip -\dbltextfloatsep
228 }%
229 \color@endbox

```

Added size test and warning message; perhaps we should use an error message.

```

230 \ifdim \ht\@currbox>\textheight
231 \ht\@currbox \textheight
232 \fi

```

This next line is not essential but it is more robust to make this value non-zero, in case of weird errors.

This next bit is what is needed from `\@addtodblcol`, plus some extra checks for error trapping.

```

233 \global \count\@currbox \tw@
234 \@tempdima -\ht\@currbox
235 \advance \@tempdima -\dbltextfloatsep
236 \global \advance \@colht \@tempdima
237 \ifx \@dbltoplist \@empty
238 \else
239 \latexerror{Float(s) lost}\@ehb
240 \let \@dbltoplist \@empty
241 \fi
242 \@cons \@dbltoplist \@currbox

```

This setting of `\@dbltopnum` is used only to change the typesetting in `\@combinedblfloats`.

```

243 \global \@dbltopnum \m@ne
244 (*trace)
245 \fl@trace{dbltopnum set to -1 (= \the \@dbltopnum) (topnewpage)}%
246 (/trace)

```

At points such as this we need to check that there is still a minimal amount of room left on the page; this uses an arbitrary small value at present; but note that this value is larger than that used when checking that page is too full of normal floats.

If there is little room left we just force a page-break, OK? This involves producing two empty columns. The second empty column may be produced by `\output`, in which case an extra, misleading, warning will be generated, OK? (This happens only when there is too little room left on the page for any float.) Otherwise (i.e. if the size is such that it is allowed as a normal float) the extra `\@emptycol` will be invoked in the second column by the conditional code guarded by the `\if@firstcolumn` test.

I now think that the cut-off point here should be `3\baselineskip`, but we make it a bit less so that 3 lines of text will be allowed, OK?

Since this happens only when there is nothing on the page but the ‘top-box’, the empty box should not cause any problem other than some overfull box messages, which is not entirely misleading.

Here we need two page-ends since both columns need to be empty.

```

247 \ifdim \@colht<2.5\baselineskip
248 \latex@warning@no@line {Optional argument of \noexpand\twocolumn
249 too tall on page \thepage}%
250 \emptycol
251 \if@firstcolumn
252 \else
253 \emptycol
254 \fi
255 \else
256 \global \vsize \@colht
257 \global \@colroom \@colht
258 \floatplacement
259 \fi
260 }

```

*(End of definition for \twocolumn and \topnewpage.)*

## 2 The L<sup>A</sup>T<sub>E</sub>X output routine

### 2.1 Hooks and replaceable code blocks

To support packages that want to augment aspects of the output routine we offer a number of hooks (where several packages can add code) as well as some sockets (that can only be changed by one package or through options like those of the `footmisc` package).

#### 2.1.1 Output routine hooks

**build/page/before, build/page/after** These two hooks enable packages to prepend or append code to the page processing in the output routine. They are implemented as mirrored hooks.

Technically, they are executed at the start and the end of the internal L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub> `\@outputpage` command, respectively.

**build/page/reset** Packages that set up special conventions for text in the main galley (such as catcode changes, etc.) can use this hook to undo these changes within the output routine, so that they aren't applied to unrelated material, e.g., the text for running header or footers.

**build/column/before, build/column/after** These two hooks enable packages to prepend or append code to the column processing in the output routine. They are implemented as mirrored hooks.

Technically, they are executed at the start and the end of the internal L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub> `\@makecol` command, respectively.

#### 2.1.2 Replaceable code blocks (sockets)

To cater for different layouts with respect to text, footnotes, and bottom-floats placements there are sockets for now. They are sockets not hooks, because the overall layout can only be controlled by one package, i.e., the last setting wins.

**build/column/outputbox (0 arguments)** In code for this socket the `\@outputbox` (holding the galley text for the current column or page) is augmented by attaching floats and footnote areas together with appropriate spacing.

Prior to calling the socket the output routine has already decided which floats go into which area and which get deferred. Therefore, the assumption is that the code in the socket attaches all areas that contain floats. If this is not done, then the order of floats is likely to be screwed up unless unused floats are moved to the defer list in an appropriate way (for now we don't offer any interface for that scenario).

Before the code in the socket is run, any existing glue at the bottom of the `\@outputbox` is removed and stored in a safe place. If needed, it can be reinserted with one of the helper commands.

To support setting this up the following helper commands are available:

**`\@outputbox@append (1 argument)`**

This general purpose command alters the `\@outputbox` box by appending material to it.

**`\@outputbox@appendfil (0 arguments)`** Append a `\vfil` to the `\@outputbox`.

Based on the plug in `build/column/baselineattach` either measured from the bottom or from the baseline of the last line in the box.

**`\@outputbox@appendfootnotes (0 arguments)`**

This command appends the footnotes to the `\@outputbox` (if there are any). If not, then it does nothing.

**`\@outputbox@attachfloats (0 arguments)`**

**`\@outputbox@attachtopfloats (0 arguments)`**

**`\@outputbox@attachbottomfloats (0 arguments)`**

Attaching top and bottom floats can usually be done in one go, but for special layouts we might want more control so we provide also separate commands.

**`\@outputbox@reinsertbskip (0 arguments)`**

Reinsert the bottom skip of the `\@outputbox` that was saved before in `\@makecol`.

### Testing for existence of material

There are a number of helpers to run conditional code depending on whether or not there are footnotes or bottom floats. They are `\@if@footnotes@TF` and `\@if@bottomfloats@TF` (names are likely to change).

This socket cannot be empty but needs appropriate code; a set of suitable plugs for it are already given in the kernel. These are

**space-footnotes-floats** After the galley text there is a vertical `\vfil` followed by any footnotes followed by the bottom floats, if any.

**footnotes-space-floats** As before but the `\vfil` is between footnotes and floats.

**floats-space-footnotes** Floats are directly after the text, then a space and then footnotes at the bottom.

**space-floats-footnotes** Both floats and footnotes are pushed to the bottom with footnotes last.<sup>63</sup>

---

<sup>63</sup>There are two more permutations, but neither of them has ever been requested so they aren't set up by default — doing that in a class would be trivial though.

**floats-footnotes** All excess space is distributed across the existing glue on the page, e.g., within the text galley, the separation between blocks, etc. The order is text, floats, footnotes.

**footnotes-floats** As the previous one but floats and footnotes are swapped. This is the L<sup>A</sup>T<sub>E</sub>X default for newer document, i.e., this plug is assigned to the socket when `\DocumentMetadata` is used.

**footnotes-floats-legacy** As the previous one but L<sup>A</sup>T<sub>E</sub>X's bottom skip bug is not corrected, i.e., in ragged bottom designs where footnotes are supposed to be directly attached to the text, they suddenly appear at the bottom of the page when the page is ended with `\newpage` or `\clearpage`. While this is clearly a bug, it was the case since the days of L<sup>A</sup>T<sub>E</sub>X 2.09; thus for compatibility we continue to support this behavior.

**build/column/footnotes (0 arguments)** This socket is used to manipulate the footnote material inside `\box\footins`. If it contains code, it is supposed to do some processing of that box and then write the result back into it (and nothing else!). By default it does nothing, i.e., has the `noop` assigned.

If (short) footnotes are run as a paragraph this socket gets the plug `para` assigned which is defined elsewhere.

**build/column/baselineattach (0 arguments)** By default, footnotes are attached after the last line of text by adding a `\vskip\skip\footins`, i.e., the space is measured from the bottom of `\@outputbox` (plug `off`). Bottom floats are attached in a similar way by using `\vskip\textfloatsep`.

The socket can get the plug `on` assigned, in which case the skip starts at the baseline of the last line in `\@outputbox`, if there is one; otherwise it starts still from the bottom of the box.

### 2.1.3 Tagging sockets

The following sockets are used to implement tagging. They are used via `\UseTaggingSocket` which turns them off when tagging is disabled. For each of them a `default` plug is implemented that holds the tagging code.

**build/column/outputbox (0 arguments)** This socket is used to add any missing tagging structures to the `\@outputbox` box, if necessary.

**build/column/footins (0 arguments)** This socket is used to add any missing tagging structures to `\footins` box, if necessary.

**build/page/header (2 arguments)** This socket receives the content of the formatted page header as its second argument and adds the necessary tagging around it. The first argument is empty as no special setup is necessary.

**build/page/footer (2 arguments)** This socket receives the content of the formatted page footer as its second argument and adds the necessary tagging around it. The first argument is empty as no special setup is necessary.

### 2.1.4 Output routine commands

`\output` This needs some small adjustments. We cannot guarantee that the float mechanism will  
`\@specialoutput` interact correctly with this stuff, but that mechanism does not always work properly with footnotes already.

RmS 91/09/29:

added reset of `\par` to the output routine. This avoids problems when the output routine is called within a list where `\par` may be a no-op.

```
261 \output {%
262   \let \par \@par
263   \ifnum \outputpenalty<-\@M
264     \@specialoutput
265   \else
266     \@makecol
267     \@opcol
```

Moved to `\@opcol: \@floatplacement`.

```
268   \@startcolumn
```

This loop could be replaced by an `\expandafter` tail recursion in `\@startcolumn`.

```
269   \@whilesw \if@fcolmade \fi
270   {%
271   (*trace)
272     \fl@trace{PAGE: float \if@twocolumn column \else page \fi
273               completed}%
274   (/trace)
275     \@opcol\@startcolumn}%
276   \fi
277   \ifnum \outputpenalty>-\@Miv
```

At points such as this we need to check that there is still a minimal amount of room left on the page; this uses an arbitrary small value at present. If there is little room left we just force a page-break, OK?

This bit is essential only if a float has just been processed so maybe it should be moved; but this is the natural place at which to set the `vsize` and a test would need to be done anyway. A check has been added to ensure that there really has been a change in the value of `\@colroom`.

Since this happens only when there is nothing on the page but floats, the empty box should not cause any problem other than some overfull box messages, which is not entirely misleading.

The `twocolumn` case does not need any extra code here since this is the `\output` itself; in the second column there will still not be enough room left so `\@emptycol` will be executed again when the OR is called by the page builder when it gets to the penalty inserted by the first execution. (The page-builder is never invoked whilst the OR is being executed since it builds a inner `vlist`; thus any conditional code for the two-column case within `\output` may not get executed with the correct value of `\if@firstcolumn`.

```
278   \ifdim \@colroom<1.5\baselineskip
279     \ifdim \@colroom<\textheight
280       \@latex@warning@no@line {Text page \thepage\space
281                                contains only floats}%
282     \@emptycol
283   %     \if@twocolumn
284   %     \if@firstcolumn
```

```

285 %           \else
286 %           \@emptycol
287 %           \fi

296   \global \vsize \maxdimen
297 \fi
298 }

```

*Historical L<sup>A</sup>T<sub>E</sub>X 2.09 comments (not necessarily accurate any more):*

CHANGES TO \@specialoutput:

\* \penalty\z@ changed to \penalty\interlinepenalty so \samepage works properly with figure and table environments.  
(Changed 23 Oct 86)

\* Definition of \@specialoutput changed 26 Feb 88 so \@pageht and \@pagedp aren't changed for a marginal note.  
(Change suggested by Chris Rowley.)

*End of historical L<sup>A</sup>T<sub>E</sub>X 2.09 comments.*

```

299 \gdef\@specialoutput{%
300   \ifnum \outputpenalty>-\@Mii
301     \doclearpage
302   \else
303     \ifnum \outputpenalty<-\@Miii
304       \ifnum \outputpenalty<-\@MM \deadcycles \z@ \fi
305       \global \setbox\@holdpg \vbox {\unvbox\@cclv}%
306     \else

```

Note that \boxmaxdepth should not be set here since we wish to record the natural depth of the holdpg box.

This is changed so as to not lose anything, such as writes and marks, which may get into box 255 and should be returned to the list. This should only happen when the first penalty in the mechanism is discarded and therefore \@holdpg should always be void in this case. This can happen because a penalty is discarded whenever there is no box on the list.

It was just: \setbox\@tempboxa \box \@cclv.

The last box which is removed is the box put there by the double-penalty mechanism. The \unskip then removes the \topskip which is put there since the box is the first on the page.

```

307   \global \setbox\@holdpg \vbox{%
308     \unvbox\@holdpg
309     \unvbox\@cclv

```

We must now remove the box added by the float mechanism and the \topskip glue therefore added above it by T<sub>E</sub>X.

```

310     \setbox\@tempboxa \lastbox
311   \unskip

```

312 }%

These two are needed as separate dimensions only by `\@addmarginpar`; for other purposes we put the whole size into `\@pageht` (see below).

```
313 \pagedp \dp\@holdpg
314 \pageht \ht\@holdpg
315 \unvbox \@holdpg
316 \@next\@currbox\@currlist{%
317 \ifnum \count\@currbox>\z@
```

Putting the whole size into `\@pageht` (see above).

```
318 \advance \@pageht \@pagedp
319 \ifvoid\footins \else
320 \advance \@pageht \ht\footins
321 \advance \@pageht \skip\footins
322 \advance \@pageht \dp\footins
323 \fi
324 \ifvbox \@kludgeins
```

We want to make the adjustment due to this insert only if the non-star form is used. The \*-form will probably not work with floats, but maybe it still could make some adjustment here even so?

```
325 \ifdim \wd\@kludgeins=\z@
326 \advance \@pageht \ht\@kludgeins
327 <{*trace}
328 \fl@trace {Extra size added: \the \ht\@kludgeins}%
329 </trace>
330 \fi
331 \fi
```

This version puts the inserts back just before the additional material; it could be moved earlier, before unboxing the page-so-far. Neither is guaranteed not to put things on the wrong page. This version is similar to the original version.

```
332 \@reinserts
333 \@addtocurcol
334 \else
335 \@reinserts
336 \@addmarginpar
337 \fi
338 }\@latexbug
```

A 2e change: use `\addpenalty` instead of `\penalty` here. Some penalty is needed to create a potential break-point immediately after the reinserts (or the marginal). Otherwise there can be no possibility to break here and this can cause the reinserts or the marginal to appear on the next page (which is often incorrect). However, if the nobreak flag is true, a `\nobreak` must be correct.

```
339 \ifnum \outputpenalty<\z@
340 \if@nobreak
341 \nobreak
342 \else
343 \addpenalty \interlinepenalty
344 \fi
345 \fi
346 \fi
347 \fi
```

```

348 }
349 </2ekernel | fltrace>

(End of definition for \output and \@specialoutput.)

```

**\@testwrongwidth** **\f@depth** Test if the float box has the wrong width when trying to place it into some area. (Actually the test is for a conventional depth setting rather than for the width of the float. For that reason the box depth was explicitly tailored when the float was created).

```

(End of definition for \@testwrongwidth and \f@depth.)

**\@docclearpage** This is a very much an emergency action, just dumping everything: footnotes first then floats. A more sophisticated version is needed; but even more urgent is a bug-free version (see, for example, pr/3528).

Also, it puts any left-over non-boxes (writes, specials, etc.) back after any float pages created: this is a very bad bug since, for example, a kludge insert will be in quite the wrong place and, worse, be irremovable and uncancelable.

All the remaining changes are replacing the double column defer list or inserting the extra test `\@testwrongwidth{<box>}` at suitable places. That is at places where a box is taken off the deferlist.

```

\@opcol Several changes in detail here.

```

470 <*2ekernel | fltrace>
471 \def \@opcol {%
472   \if@twocolumn

```

The funny-looking internal commands are interfacing with the new marks mechanism. We make sure (elsewhere) that those are always defined, even when we roll back, so here we add them unconditionally. This still need turning into a hook or config point eventually:

```

473 \expl@@@mark@update@dblcol@structures@@
474 \outputdblcol
475 \else
476 \expl@@@mark@update@singlecol@structures@@
477 \outputpage
478 <*trace>
479 \fl@trace{PAGE: one column (float? see above) page completed}%
480 </trace>

```

Not needed since it comes after `\@outputpage`:

```

481 % \global\@colht\textheight
482 \fi

```

These do not need to be done every time `\@opcol` is used: they should be grouped together since they all need to be done at the end of the non-special output routine, or at the end of a clearpage one.

```

483 \global \@mparbottom \z@ \global \@textfloatsheight \z@
484 \@floatplacement
485 }
486 </2ekernel | fltrace>

```

*(End of definition for \@opcol.)*

```

487 <*2ekernel | latexrelease>
488 <latexrelease>\IncludeInRelease{2025/06/01}%
489 <latexrelease> {\@makecol}{\@makecol adding hooks/sockets}%

```

`\@makecol` `\@makecol` is shortened a lot, basically all the hardwired code in the middle has moved into a socket.

```

490 \def \@makecol {%

```

A number of packages want to prepend code to `\@makecol`; this is the hook for that:

```

491 \UseHook {build/column/before}%

```

Save away box 255 as `\@outputbox` to make it available for further adjustments.

```

492 \setbox\@outputbox \box\@cclv

```

The only real addition is the next command which either does nothing or removes an infinite glue from the bottom of the `\@outputbox`.

```

493 \@outputbox@removebskip

```

Now a kernel hook for tagging that adjusts the content of `\@outputbox`, if necessary. At this point it just contains the material from the galley.

```

494 \UseTaggingSocket{build/column/outputbox}%

```

When this code is run any “here” floats in the `\@outputbox` are already handled, so we recycle their registers and put them back to the `\@freelist`.

```

495 \let\@elt\relax
496 \xdef\@freelist{\@freelist\@midlist}%
497 \global \let \@midlist \@empty

```

Here we have the configurable part. This socket is supposed to add floats, footnotes and stretchable vertical space as appropriate to the `\@outputbox`. It is used by packages such as `footmisc` to implement different layout, e.g., footnotes above or below bottom floats, etc.

```
498 \UseSocket {build/column/outputbox}%
```

Then we deal with any `\enlargethispage` or run the normal code to build a column.

```
499 \ifvbox\@kludgeins
500   \@make@specialcolbox
501 \else
502   \@make@normalcolbox
503 \fi
504 \global \maxdepth \@maxdepth
```

Finally, another hook for external packages or classes that want to augment or alter the output routine by appending to `\@makecol`.

```
505 \UseHook {build/column/after}%
506 }
```

*(End of definition for \@makecol.)*

`\@outputbox@depth` We need to know the depth of `\@outputbox` once in a while. Rather than using a temp dimen (as it was done in the past), we give it a proper register.

The value of this register is only correct inside of `\outputbox@append`, elsewhere you can't rely on it!

```
507 \newdimen\@outputbox@depth
```

*(End of definition for \@outputbox@depth.)*

`\@make@normalcolbox` Taken out of `\@makecol` for readability.

```
508 \def \@make@normalcolbox {%
509   \setbox\@outputbox \vbox to\@colht {%
510     \@texttop
511     \@outputbox@depth \dp\@outputbox
512     \unvbox \@outputbox
```

The `\vskip -\@outputbox@depth` ensures that the visible depth of the box does not affect the placement of anything on the page. Thus very deep pages will overprint the footer; but these should have been prevented by suitable settings of the maxdepths at appropriate times.

If `\@textbottom` ends with a box or rule of non-zero depth then this skip adjustment should be done again after it.

```
513   \vskip -\@outputbox@depth
514   \@textbottom
515 }%
516 }
```

*(End of definition for \@make@normalcolbox.)*

`\@make@specialcolbox` Make the colbox when `\enlargethispage` was used.

```
517 </2kernel | latexrelease>
518 <*2kernel | latexrelease | fltrace>
519 \def \@make@specialcolbox {%
520 <*trace>
```

```

521 \fl@trace{Kludgeins ht \the\ht\@kludgeins\space
522         dp \the\dp\@kludgeins\space
523         wd \the\wd\@kludgeins}%
524 
```

Note that in this case (the \*-version), the height of the `\@kludgeins` box is not used since its value is somewhat arbitrary: it need only be big enough to ensure that the page-break is not taken prematurely.

Here we calculate how much vertical space needs to be added in order to enable the column to fit into a box of size `\@colht` using the best information we have about the amount of shrink available (another thing which is known internally about a box, but cannot be accessed at the  $\text{\TeX}$  level!).

This needs  $\text{\TeX}$ 3 otherwise `\pageshrink` is zero anyway; it may not be exactly the figure we wish as it is the total available from the all the material collected before the page-break decision is made. It will, we think, always be an overestimate of the actual shrink in the box; therefore this should always force the shortest possible column with the possibility of an overfull box.

This should work for both flush- and ragged-bottom setting since it makes the contents no smaller than the size (`\@colht`) of the box into which they are put.

Their should perhaps be an upper limit, of 0pt?, on the extra space added to force shrinking.

```

528 \advance \@tempdima -\ht\@outputbox
529 \advance \@tempdima \pageshrink
530 (*trace)
531 \fl@trace {Natural ht of col: \the \ht\@outputbox}%
532 \fl@trace {\string \@colht: \the \@colht}%
533 \fl@trace {Pageshrink added: \the \pageshrink}%
534 \fl@trace {Hence, space added: \the \@tempdima}%
535 
```

For the unstarred version, the final size of the page is precisely specified. Therefore, at least for the flush-bottom case, we need to ensure that, visually, it has this size exactly.

Thus we calculate this size and set the material in a box of this size, which is then put into a box of size `\@colht` with `\vss` at the bottom.

```

541 \else
542 \advance \@tempdima -\ht\@kludgeins
543 (*trace)
544 \fl@trace {Natural ht of col: \the \ht\@outputbox}%
545 \fl@trace {\string \@colht: \the \@colht}%
546 \fl@trace {Extra size added: -\the \ht \@kludgeins}%
547 \fl@trace {Hence, height of inner box: \the \@tempdima}%
548 \fl@trace {Max? pageshrink available: \the \pageshrink}%
549 
```

This type of final packaging could be done always; this may simplify all of this page-makeup.

It is not necessary to set `\boxmaxdepth` here since the `\@outputbox` ends with glue.

```

550     \setbox \@outputbox \vbox to \@colht {%
551         \vbox to \@tempdima {%
552             \unvbox\@outputbox
553             \@textbottom}%
554         \vss}%
555     \fi
556     {\setbox \@tempboxa \box \@kludgeins}%
557     <*trace>
558     \fl@trace {kludgeins box made void}%
559     </trace>
560 }
561 </2ekernel | latexrelease | fltrace>
562 <*2ekernel | latexrelease>

```

*(End of definition for \@make@specialcolbox.)*

**\@outputbox@removebskip** This is really a bug fix for the kernel (from the 2.09 days) but one we only make by default in new documents that are using `\DocumentMetadata`. If `\raggedbottom` is in force, footnotes get attached to the main galley at a distance of `\footskip` on all pages except on those that are ended by `\newpage` or `\clearpage` where the `\vfil` from `\newpage` pushes the footnotes to the very bottom.

This is kind of a weird difference to a page ending with `\pagebreak`—in that case the page is also run short, but the footnotes are not pushed to the bottom.

In `footmisc` `\@outputbox@removebskip` is only applied when `footmisc` is called with an option specifying the footnote placement, i.e., not in the default case. In new documents we apply it always.

```

563 \def\@outputbox@removebskip{%

```

In some special circumstances the `\@outputbox` might be void. As `\@outputbox@append` below would change this, we handle this case by leaving it unchanged, because otherwise we can no longer detect that situation (needed, for example, in `ftnright`).

```

564     \ifvoid \@outputbox
565         \global\let\@outputbox@reinsertbskip\relax
566     \else

```

If it is not void then we drop the final skip at the end of `\@outputbox` provided there is one and it has a glue stretch order of 1 or more (i.e., contains a `fil` or `fill` part).

```

567     \@outputbox@append{%
568         \@tempskipa\lastskip
569         \ifnum \gluestretchorder\@tempskipa>\z@
570             \unskip

```

We also prepare for reinserting the skip we removed elsewhere on the page. As we have to do this globally, we also need to explicitly reset `\@outputbox@reinsertbskip` if we don't find any such glue.

**\@outputbox@reinsertbskip**

```

571         \xdef\@outputbox@reinsertbskip
572         {%

```

Everything is done inside `\@outputbox@append` so that a call to `\@outputbox@reinsertbskip` will update the box. If there are no footnotes and no bottom floats that still needs to be attached we first backup by the depth of the `\@outputbox` so that the skip we add starts from the baseline of the last line inside (if there is one). As it is a `fil`, `fill`, or `filll` glue this normally makes no differences, but if the box itself contains a fill skip of higher order our fill is ignored and text is pushed to the bottom of the page. In that case and without backing up first, the last line would not be with its baseline on the bottom, but slightly too high if it has characters with descenders.

```

573         \noexpand\@outputbox@append{%
574         \noexpand\@if@footnotes@TF
575         {}%
576         {%
577         \noexpand\@if@bottomfloats@TF
578         {}%
579         {\noexpand\@backup@outputbox@depth}%
580         }%
581         \vskip\the\@tempskipa}}%
582     \else
583     \global\let\@outputbox@reinsertbskip\relax
584     \fi
585 }%
586 \fi
587 }

```

We need a trivial top-level definition for `\@outputbox@reinsertbskip` in case the first page has no bottom glue and the command gets called.

```

588 \let \@outputbox@reinsertbskip \relax

```

*(End of definition for \@outputbox@removebskip and \@outputbox@reinsertbskip.)*

`\@backup@outputbox@depth`

In some places we have to make the depth of the `\@outputbox` zero by backing up by its current depth. This is done by `\@backup@outputbox@depth`. The macro can only be used inside of `\@outputbox@append` (or after you have manually set the `\@outputbox@depth` to the right value).

If the depth is zero, there is no point in doing anything, and if the depth is negative it must have been deliberately set to this value, so in this case we also do not back up and change it.

If it is positive we back up by the minimum of `\@outputbox@depth` and `\maxdepth`, i.e., if the depth is unusually large we do not perform a full backup.

```

589 \def\@backup@outputbox@depth{%
590 % \typeout{--> \@backup@outputbox@depth : \the \@outputbox@depth}%
591 \ifdim\@outputbox@depth>\z@
592 \vskip -%
593 \ifdim\@outputbox@depth>\maxdepth
594 \maxdepth
595 \else
596 \@outputbox@depth
597 \fi

```

After the skip was added the depth of the box will become zero but this is not immediately reflected in `\@outputbox@depth`. Thus, if there is further code in the same `\@outputbox@append` testing the register it would make a wrong conclusion. We therefore set it locally to zero.

```

598     \@outputbox@depth\z@
599     \fi
600 }

```

*(End of definition for \@backup@outputbox@depth.)*

## 2.2 The output routine configuration components

Here we provide the commands that are used to define code for the socket `build/column/outputbox`. The all manipulate the `\@outputbox` box in one way or another.

**\@outputbox@append** This general purpose command alters the `\@outputbox` box by appending material to it. As this is a box typesetting operation we make sure that the last line of the box reflects the true depth of the last line (in case that is needed later). We also expose the current depth of `\@outputbox` as `\@outputbox@depth` before unboxing so that its value can be used by `#1` if wanted.

```

601 \def\@outputbox@append #1{%
602     \setbox\@outputbox \vbox {%

```

This `\boxmaxdepth` setting is to ensure that deep footnotes do not overwrite the footer (on account of the negative skip added later): it should use `\@maxdepth` otherwise the change is pointless when there are footnotes.

But see also its use when combining floats.

```

603     \boxmaxdepth \@maxdepth
604     \@outputbox@depth\dp\@outputbox      % if needed in #1
605     \unvbox \@outputbox
606     #1%
607 }%
608 }

```

*(End of definition for \@outputbox@append.)*

**\@outputbox@appendfil** Append a `\vfil` to the `\@outputbox`. Depending on the plug in the `build/column/baselineattach` either from the bottom of the box or the baseline of the last line.

```

609 \def\@outputbox@appendfil{\@outputbox@append
610     {\UseSocket{build/column/baselineattach}\vfil}}

```

*(End of definition for \@outputbox@appendfil.)*

**\@outputbox@appendfootnotes** This command appends the footnotes to the `\@outputbox` (if there are any). If not, then it does nothing.

```

611 \def\@outputbox@appendfootnotes {%
612     \ifvoid\footins \else

```

Handling split footnotes need further work so this is for the moment just a dummy that does nothing. It might vanish and get replaced by a socket eventually.

```

613     \@makecol@handlesplitfootnotes

```

The following socket can be used to manipulate the material in `\footins` box, for example, if the footnotes are to be presented all together in a single paragraph. By default it does nothing.

```

614     \UseSocket{build/column/footnotes}%

```

Then the footnotes are appended:

```

615     \@outputbox@append{%

```

First we call a socket which controls whether or not we back up by the depth of the `\@outputbox` so that the skip that separates the footnotes from the text starts at the baseline of the last text line.

```
616      \UseSocket{build/column/baselineattach}%
617      \vskip \skip\footins
```

The next socket adjusts the tagging of the `\footins` box, if necessary.

```
618      \UseTaggingSocket{build/column/footins}%
619      \color@begingroup
620      \normalcolor
621      \footnoterule
```

Support for `pdfcolfoot`; eventually this can go once color is properly supported. The `csname` is constructed in case the command is not defined, i.e., the package not loaded.

```
622      \csname pdfcolfoot@current\endcsname
623      \unvbox \footins
624      \color@endgroup
625  }%
626 \fi
627 }
```

*(End of definition for \@outputbox@appendfootnotes.)*

`\@makecol@handlesplitfootnotes` For future extensions ...

```
628 \let \@makecol@handlesplitfootnotes \@empty
```

*(End of definition for \@makecol@handlesplitfootnotes.)*

`\@outputbox@attachfloats`  
`\@outputbox@attachtopfloats`  
`\@outputbox@attachbottomfloats`

Attaching top and bottom floats can usually be done in one go, but for special layouts we might want more control so we provide also separate commands.

The next command was called `\@combinefloats` in the past.

```
629 \def \@outputbox@attachfloats {%
630     \@outputbox@attachtopfloats
631     \@outputbox@attachbottomfloats
632 }
633 \def \@outputbox@attachtopfloats {%
634     \ifx \@toplist\@empty \else \@cflt \fi
635 }
```

Before we append the bottom floats we run the `build/column/baselineattach` so that the `\textfloatsep` is measured from the baseline if that is desired.

```
636 \def \@outputbox@attachbottomfloats {%
637     \ifx \@botlist\@empty \else
638         \@outputbox@append{\UseSocket{build/column/baselineattach}}%
639         \@cflb
640     \fi
641 }
```

*(End of definition for \@outputbox@attachfloats, \@outputbox@attachtopfloats, and \@outputbox@attachbottomfloats.)*

The next three conditionals might be useful when setting up running headers and footers so perhaps they should be change to CamelCase names. For now they are internal.

`\@if@flushbottom@TF` Test for `\flushbottom` (currently not used).

```
642 \def\@if@flushbottom@TF{%
643   \ifx\@textbottom\relax
644     \expandafter\@firstoftwo
645   \else
646     \expandafter\@secondoftwo
647   \fi
648 }
```

*(End of definition for \@if@flushbottom@TF.)*

`\@if@footnotes@TF` Test if footnotes are present on the current page or column and not yet added to the `\@outputbox`.

```
649 \def\@if@footnotes@TF{%
650   \ifvoid\footins
651     \expandafter\@secondoftwo
652   \else
653     \expandafter\@firstoftwo
654   \fi
655 }
```

*(End of definition for \@if@footnotes@TF.)*

`\@if@bottomfloats@TF` Test if bottom floats are around and not yet added to the `\@outputbox`.

```
656 \def\@if@bottomfloats@TF{%
657   \ifx \@botlist\@empty
658     \expandafter\@secondoftwo
659   \else
660     \expandafter\@firstoftwo
661   \fi
662 }
```

*(End of definition for \@if@bottomfloats@TF.)*

`build/column/outputbox (socket)` We have one socket that is supposed to augment the `\@outputbox` by attaching floats and footnotes with appropriate spacing.

```
663 \NewSocket{build/column/outputbox}{0}
```

The following plugs are available for this socket:

`space-footnotes-floats (plug)` After the galley text there is a vertical `\vfil` followed by any footnotes followed by the bottom floats, if any.

```
664 \NewSocketPlug {build/column/outputbox}{space-footnotes-floats} {%
665   \@if@footnotes@TF
666     {\@outputbox@appendfil}%
667   {\@if@bottomfloats@TF
668     {\@outputbox@appendfil}%
669     {\@outputbox@reinsertbskip}%
670   }%
671   \@outputbox@appendfootnotes
672   \@outputbox@attachfloats
673 }
```

`footnotes-space-floats` (*plug*) As before but the `\vfil` is between footnotes and floats.

```

674 \NewSocketPlug {build/column/outputbox}{footnotes-space-floats} {%
675   \@outputbox@appendfootnotes
676   \@if@bottomfloats@TF
677     {\@outputbox@appendfil}%
678     {\@outputbox@reinsertbskip}%
679   \@outputbox@attachfloats
680 }

```

`floats-space-footnotes` (*plug*) Floats immediately after the galley text and footnotes at the bottom.

```

681 \NewSocketPlug {build/column/outputbox}{floats-space-footnotes} {%
682   \@outputbox@attachfloats
683   \@if@footnotes@TF
684     {\@outputbox@appendfil}%
685     {\@outputbox@reinsertbskip}%
686   \@outputbox@appendfootnotes
687 }

```

`space-floats-footnotes` (*plug*) Both floats and footnotes are pushed to the bottom with footnotes last.<sup>64</sup>

```

688 \NewSocketPlug {build/column/outputbox}{space-floats-footnotes} {%
689   \@if@bottomfloats@TF
690     {\@outputbox@appendfil}%
691     {\@if@footnotes@TF
692       {\@outputbox@appendfil}%
693       {\@outputbox@reinsertbskip}}%
694   \@outputbox@attachfloats
695   \@outputbox@appendfootnotes
696 }

```

`floats-footnotes` (*plug*) All excess space has to be distributed across the existing glue on the page, e.g., within the text galley, the separation between blocks, etc. The order is text, floats, footnotes.

```

697 \NewSocketPlug {build/column/outputbox}{floats-footnotes} {%
698   \@outputbox@attachfloats
699   \@outputbox@appendfootnotes

```

We do reinsert the bottom skip from `\newpage` if it was taken out earlier. This is, strictly speaking, not necessary in most cases, but it is a `\vfil` while `\raggedbottom` is only generating `\vspace{0pt plus .0001fil}`, so if you have several `\vfil` on the page before the `\newpage` you would alter the space distribution if one is taken out.

```

700   \@outputbox@reinsertbskip
701 }

```

`footnotes-floats` (*plug*)

```

702 \NewSocketPlug {build/column/outputbox}{footnotes-floats} {%
703   \@outputbox@appendfootnotes
704   \@outputbox@attachfloats
705   \@outputbox@reinsertbskip
706 }

```

---

<sup>64</sup>There are two more permutations, but neither of them has ever been requested so they aren't set up by default — doing that in a class would be trivial though.

The `footnote-floats` plug implements the layout used by L<sup>A</sup>T<sub>E</sub>X but with the bottom skip bug corrected. This will be the default when `\DocumentMetadata` is used; it can be overwritten either through `footmisc` or by assigning any of the other plugs (or by coding yet another plug for the socket).

`footnotes-floats-legacy` (*plug*) This implements the 2.09 layout (including its bottom skip bug).

```
707 \NewSocketPlug {build/column/outputbox}{footnotes-floats-legacy} {%
```

In the legacy case we don't really want to take out the bottom skip, but rather than altering `\@outputbox@removebskip` in `\makecol` to do nothing, which we would then have to undo in every other layout, we immediately reinsert the dropped skip again.

In the legacy case there is, however, one other thing that needs doing: if there was a `\vfil` at the bottom of the page (e.g., from `\newpage`) and there are no footnotes, then we need to back up by the depth of the last line in the page box. Otherwise you might end up with incorrect alignment if there is a higher-order fill on the page (e.g., `\vfill`) that pushes the text material to the bottom, since in such cases the depth will not be taken into account by T<sub>E</sub>X.

This is done automatically by `\@outputbox@reinsertbskip` as long as there are no footnotes waiting to be placed. If there are footnotes, the operation is not done because by default the `\skip\footins` separation is measured from the bottom of the line not from the baseline. But if the user has asked to change this behavior we should honor it and that is done by putting the experimental socket `build/column/baselineattach` in which performs the backing up if desired. This should happen only if footnotes are actually present, so we test for this. Otherwise, there may be bottom floats and the `\textfloatsep` should be measured from the bottom of the last line and if not then any necessary back up is done by `\@outputbox@reinsertbskip`.

Note that after this code has backed up, the depth of `\@outputbox` will be zero as there is a skip at its bottom. So even if the same code is executed a second time (in `\@outputbox@reinsertbskip` or in `\@outputbox@appendfootnotes`) it will not alter the box further.

```
708 \if@footnotes@TF
709   {\@outputbox@append{%
710     \UseSocket{build/column/baselineattach}}}%
711   }{%
```

If there are no footnotes but there are bottom floats we execute the socket `build/column/baselineattach` so that `\textfloatsep` is measured from the baseline if that is being asked for.

```
712 \if@bottomfloats@TF
713   {\@outputbox@append{%
714     \UseSocket{build/column/baselineattach}}}%
715   }{%
716   }%
717 \@outputbox@reinsertbskip
718 \@outputbox@appendfootnotes
719 \@outputbox@attachfloats
720 }
```

The `footnote-floats-legacy` plug is the default used by L<sup>A</sup>T<sub>E</sub>X when `\DocumentMetadata` is not used; it can be overwritten either through `footmisc` or by assigning any of the other plugs (or by coding yet another plug for the socket).

```
721 \AssignSocketPlug {build/column/outputbox}{footnotes-floats-legacy}
```

**build/column/footnotes** (*socket*) The socket allowing the manipulation of `\footins` box (result needs to be moved back in there). Used when footnotes are reformatted into a single paragraph by the `para` option of `footmisc`. By default it does nothing.

```
722 \NewSocket{build/column/footnotes}{0}
```

**build/column/baselineattach** (*socket*) Socket that allows backing up by the depth of the outputbox (but not more than `\maxdepth` before attaching any footnotes or floats.

```
723 \NewSocket{build/column/baselineattach}{0}
```

**on** (*plug*)

```
724 \NewSocketPlug {build/column/baselineattach}{on} {%
```

We do nothing if the depth is not positive, and we never back up by more than `\maxdepth`.

```
725 \@backup@outputbox@depth
```

```
726 }
```

**off** (*plug*) The `off` plug is actually identical to the `noop` plug which is automatically made available; but offering that it under the name `off` makes the interface a bit nicer.

```
727 \NewSocketPlug {build/column/baselineattach}{off}{}%
```

This feature is not turned on by default to preserve the behavior of old documents. With new documents using `\DocumentMetadata` it may become the default.

```
728 \AssignSocketPlug {build/column/baselineattach}{off}
```

**build/page/before** (*hook*) Hooks at the start and end of `\@outputpage` for use by packages.

**build/page/after** (*hook*) 729 \NewMirroredHookPair{build/page/before}{build/page/after}

**build/page/reset** (*hook*) Hook in `\@outputpage` to reset special galley conventions within the output routine. L<sup>A</sup>T<sub>E</sub>X does a lot of resetting in front of this hook, so by default it is empty. They are not made part of the hook (which would have been possible) to ensure that the kernel resets always come first and can be overwritten without the need to apply hook rules unnecessarily.

```
730 \NewHook {build/page/reset}
```

**build/column/before** (*hook*) Hooks at the start and end of `\@makecol` for use by packages.

**build/column/after** (*hook*) 731 \NewMirroredHookPair{build/column/before}{build/column/after}

```

(End of definition for \@resetactivechars and \@activechar@info.)

\@outputpage The \@color@hbox hooks here are used to avoid putting just a colour special into an otherwise empty box (in a header or footer). These boxes are often set to be completely empty and so adding a special produces a very underfull box message.

There has been extensive tidying up of the old code here; including the removal of a level of grouping.

The setting of \@protect immediately before the \@shipout is needed so that protected commands within \@writes are handled correctly.

Within shipout's vbox it is reset to its default value, \@relax.

Resetting it to its default value after the shipout has been completed (and the contents of the writes have been expanded) must be done by use of \@aftergroup. This is because it must have the value \@relax before macros coming from other uses of \@aftergroup within this box are expanded.

Putting this into the \@aftergroup token list does not affect the definition used in expanding the \@writes because the aftergroup token list is only constructed when popping the save-stack, it is not expanded until after the shipout is completed.

Question: should things from an \@aftergroup within the shipped out box be executed in the environment set up for the writes, or after it finishes?

A lot of this code has been in-lined to prevent mis-use of internal commands as hooks.

```

841 </2ekernel>
842 <latexrelease>\IncludeInRelease{2025/06/01}%
843 <latexrelease> {\@outputpage}{Use new mark mechanism}%
844 <*2ekernel|latexrelease>

```

Temp definition to vanish again when something is offered by the backend:

```

845 \protected \def \pdfannot@link@on@@ { \csname pdfannot_link_on:\endcsname }
846 \protected \def \pdfannot@link@off@@ { \csname pdfannot_link_off:\endcsname }
847 \def \@outputpage {%

```

We start with a hook available to packages that want to prepend code to \@outputpage.

```

848 \UseHook {build/page/before}%

```

The \@endgroup is put in by \@aftergroup.

```

849 \begingroup

```

Now all the set-up stuff has been in-lined for Frank.

First the stuff for the writes.

From here on was originally in the command \@writsetup.

RmS 93/08/19: Redefined accents to allow changes in font encoding; but exactly why was this needed?

Reset \@language to the value current at \@begin{document}. In particular this ensures that a pagebreak in verbatim does not prevent hyphenation in the page head.

```

850 \language\document@default@language

```

Now a few more resets for things that may have changed during galley processing. We start with resetting some active character definitions.

```

851 \@resetactivechars

```

Then we deal with catcodes that might got altered by `verbatim` or similar environments and reset them to standard values.

```

852 \catcode'\z@
853 \catcode'\@ne
854 \catcode'\tw@
855 \catcode'\$thr@@
856 \catcode'\&4\relax
857 \catcode'\^M5\relax
858 \catcode'\#6\relax
859 \catcode'\^7\relax
860 \catcode'\_8\relax
861 \catcode'\ 10\relax
862 \catcode'\^^I10\relax
863 \@makeother\<%
864 \@makeother\>%
865 \@makeother\*%
866 \@makeother\.%
867 \@makeother\-%
868 \@makeother\/%
869 \@makeother\[%
870 \@makeother\]%
871 \@makeother\'%
872 \@makeother\'%
873 \@makeother\"%
874 \catcode'\~13\relax
875 \catcode'\%14\relax

```

If a page break happens between the start of a list and its first item then `@newlist` will be true and this will mess up any list that is used in the header or footer of the page. So we have to reset that flag.

```

876 \global\let\@@if@newlist\if@newlist
877 \global\@newlistfalse

```

This next hook replaces the following:

```

\let\-\@dischyph
\let\'\'@acci\let\'\'@accii\let\=\@acciii
\let\\\@normalcr
\let\par\@par %% 15 Sep 87 (this was once inside the box)

```

and it does more than they did; in particular it sets:

```

\parindent\z@
\parskip\z@skip
\everypar{}%
\leftskip\z@skip
\rightskip\z@skip
\parfillskip\@flushglue
\lineskip\normallineskip
\baselineskip\normalbaselineskip
\sloppy

878 \@parboxrestore

```

... to here was in the command `\@writsetup`.

Hook to allow adding resets local to the output routine processing, e.g., in `\write` or running headers/footers, for packages that set up special conventions in the main galley that should not leak into the page production just because a page break happens in the middle of such an environment.

```
879 \UseHook {build/page/reset}%
```

The following definition of `\protect` is the one active during the `\write` statement that migrate out of the `\shipout` box, so even though it is immediately changed below (inside `\shipout` it still has to be here!

```
880 \let \protect \noexpand
```

```
881 \shipout \vbox{%
```

Inside the `\shipout` box we have a different setting for `\protect`.

```
882 \set@typeset@protect
```

```
883 \aftergroup \endgroup
```

Once the `\shipout` boxes ends `\protect` is again `\noexpand` which is correct for any `\write` statements, but once they are processed we want to get back to the following setting:

```
884 \aftergroup \set@typeset@protect
```

Now the setup inside the shipped out box; this should contain all the stuff that could only affect typesetting; other stuff may need to be reset for the writes also.

From here ... was in the command `\@shipoutsetup`.

```
885 \if@specialpage
886 \global \@specialpagefalse
887 \@nameuse {ps@\@specialstyle}%
888 \fi
889 \if@twoside
890 \ifodd\count\z@
891 \let \@thehead \@oddhead
892 \let \@thefoot \@oddfoot
893 \let \@themargin \oddsidemargin
894 \else
895 \let \@thehead \@evenhead
896 \let \@thefoot \@evenfoot
897 \let \@themargin \evensidemargin
898 \fi
899 \fi
```

The rest was always inside the box.

RmS 91/08/15: added this line:

```
900 \reset@font
```

RmS 93/08/06 Added `\lineskiplimit=0pt` to guard against it being nonzero: e.g. by `\offinterlineskip` being in effect.

There are probably lots of other things that may need resetting.

```
901 \normalsize
```

Reset the space factors.

```
902 \normalsfcodes
```

Reset these here (previously reset separately for head and foot)

```

## 2.2.1 Dealing with floats

**\@combinefloats** Old name for what is now called \@outputbox@attachfloats; kept to support legacy packages.

```

1068 \let \@combinefloats \@outputbox@attachfloats

```

*(End of definition for \@combinefloats.)*

**\@cflt** The \boxmaxdepth setting here was not made local to a box so was dangerous. It is  
**\@cflb** needed only within the box made by \@cflt (and not normally even there), so it has been moved there; this also agrees with the original pseudocode.

```

1069 \def \@cflt{%
1070   \let \@elt \@comflelt
1071   \setbox\@tempboxa \vbox{}%
1072   \@toplist
1073   \setbox\@outputbox \vbox{%

```

```

1434     \else
1435     \@flsettextmin

```

This is a new adjustment which is quite a major change in functionality; but it implements the documentation. Note that `\@reqcolroom` will include the whole of the page-so-far, and hence includes `\@textfloatsheight` of floats, so before comparing it with `\@textmin`, we add this to `\@textmin` also.

```

1436 \<trace>
1437     \fl@trace{textfloatsheight (before) = \the \@textfloatsheight}%
1438 \</trace>
1439     \advance \@textmin \@textfloatsheight
1440     \@reqcolroom \@pageht

```

This line must be removed since `\@specialoutput` changed.

```

1441 %     \advance \@reqcolroom \@pagedp
1442 \<trace>
1443     \fl@trace{textmin + textfloatsheight: \the \@textmin}%

1497         \fl@trace{colnum (after-here) = \the \@colnum}%
1498 </trace>

```

CHANGE TO \@addtocurcol:

\penalty\z@ changed to \penalty\interlinepenalty so \samepage works properly with figure and table environments. (Changed 23 Oct 86)

There is also an \addpenalty\interlinepenalty above.

Although it is best to use \addvspace in case two h floats come together, this makes other spacing more difficult to adjust; whereas if a user specifies two h floats together then they can more easily get the spacing correct by ad hoc commands.

It is necessary to adjust for the addition of \parskip here in case the float is added between paragraphs (i.e. when in vertical mode).

If the nobreak switch is true we need to reset it and clear \everypar since the float may not reset the flag and cannot reset the \everypar globally.

Typesetting starts here (we are in vertical mode).

```

1499         \if@nobreak
1500             \nobreak
1501             \@nobreakfalse
1502             \everypar{}%
1503         \else
1504             \addpenalty \interlinepenalty
1505             \fi
1506             \vskip \intextsep
1507             \box\@currbox
1508             \penalty\interlinepenalty
1509             \vskip\intextsep
1510             \ifnum\outputpenalty <-\@Mii \vskip -\parskip\fi

```

Typesetting ends here.

```

1511         \outputpenalty \z@
1512         \@inserttrue
1513 <*trace>

```

```

CHANGE TO \@addtocurcol:

\penalty\z@ changed to \penalty\interlinepenalty so \samepage works properly with figure and table environments. (Changed 23 Oct 86)

There is also an \addpenalty\interlinepenalty above.

Although it is best to use \addvspace in case two h floats come together, this makes other spacing more difficult to adjust; whereas if a user specifies two h floats together then they can more easily get the spacing correct by ad hoc commands.

It is necessary to adjust for the addition of \parskip here in case the float is added between paragraphs (i.e. when in vertical mode).

If the nobreak switch is true we need to reset it and clear \everypar since the float may not reset the flag and cannot reset the \everypar globally.

Typesetting starts here (we are in vertical mode).

```

1809 <latexrelease | fltrace | flafter> \if@nobreak
1810 <latexrelease | fltrace | flafter> \nobreak
1811 <latexrelease | fltrace | flafter> \@nobreakfalse
1812 <latexrelease | fltrace | flafter> \everypar{}%
1813 <latexrelease | fltrace | flafter> \else
1814 <latexrelease | fltrace | flafter> \addpenalty\interlinepenalty
1815 <latexrelease | fltrace | flafter> \fi
1816 <latexrelease | fltrace | flafter> \vskip \intextsep
1817 <latexrelease | fltrace | flafter> \box\@currbox
1818 <latexrelease | fltrace | flafter> \penalty\interlinepenalty
1819 <latexrelease | fltrace | flafter> \vskip\intextsep
1820 <latexrelease | fltrace | flafter> \ifnum\outputpenalty
1821 <latexrelease | fltrace | flafter> <-\@Mii \vskip
1822 <latexrelease | fltrace | flafter> -\parskip\fi

```

Typesetting ends here.

```

1823 <latexrelease | fltrace | flafter> \outputpenalty \z@

2383 <latexrelease|fltrace> \fl@trace{dbltop: \the \@dbltopnum.}%
2384 </trace>
2385 <latexrelease|fltrace>}%
2386 <latexrelease|fltrace>\EndIncludeInRelease

```

(End of definition for \@addtodblcol.)

\@addmarginpar

```

2387 <*2kernel>
2388 \def\@addmarginpar{\@next\@marbox\@currlist{\@cons\@freelist\@marbox
2389 \@cons\@freelist\@currbox}\@latexbug\@tempcnta\@ne
2390 \if@twocolumn
2391 \if@firstcolumn \@tempcnta\m@ne \fi
2392 \else
2393 \if@mparswitch
2394 \ifodd\c@page \else\@tempcnta\m@ne \fi
2395 \fi
2396 \if@reversemargin \@tempcnta -\@tempcnta \fi
2397 \fi
2398 \ifnum\@tempcnta <\z@ \global\setbox\@marbox\box\@currbox \fi
2399 \@tempdima\@mparbottom
2400 \advance\@tempdima -\@pageht
2401 \advance\@tempdima\ht\@marbox
2402 \ifdim\@tempdima >\z@
2403 \latex@warning@no@line {Marginpar on page \thepage\space moved}%
2404 \else
2405 \@tempdima\z@
2406 \fi
2407 \global\@mparbottom\@pageht
2408 \global\advance\@mparbottom\@tempdima
2409 \global\advance\@mparbottom\dp\@marbox
2410 \global\advance\@mparbottom\marginparpush
2411 \advance\@tempdima -\ht\@marbox

```

Putting box movement inside the ‘marbox’:

```

2412 \global\setbox \@marbox
2413 \vbox {\vskip \@tempdima
2414 \box \@marbox}%
2415 \global \ht\@marbox \z@
2416 \global \dp\@marbox \z@

```

Sticking (rather than gluing:-) the ‘marbox’ to the line above, changed vskip to kern:

```

2417 \kern -\@pagedp
2418 \nointerlineskip
2419 \hb@xt@\columnwidth
2420 {\ifnum \@tempcnta >\z@
2421 \hskip\columnwidth \hskip\marginparsep
2422 \else
2423 \hskip -\marginparsep \hskip -\marginparwidth
2424 \fi
2425 \box\@marbox \hss}%

```

For this reason the following code can vanish:

```

\nobreak          %% No longer needed.  CAR92/12
\vskip -\@tempdima  %% No longer needed.  CAR92/12

```

```

2426 \nointerlineskip
2427 \hbox{\vrule \@height\z@ \@width\z@ \@depth\@pagedp}}

```

(End of definition for \addmarginpar.)

### 2.2.2 Kludgeins

This part of the file is part of the implementation of the following two new commands for L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub>.

`\enlargethispage{<dim>}`

Adds <dim> to the height of the current column only. On the printed page the bottom of this column is extended downwards by exactly <dim> without having any effect on the placement of the footer; this may result in an overprinting.

`\enlargethispage*{<dim>}`

Similar to `\enlargethispage` but it tries to squeeze the column to be printed in as small a space as possible, ie it uses any shrinkability in the column. If the column was not explicitly broken (e.g. with `\pagebreak`) this may result in an overfull box message but except for this it will come out as expected (if you know what to expect).

The star form of this command is dedicated to Leslie Lamport, the other we need for ourselves (FMi, CAR).

These commands may well have unwanted effects if used soon before a `\clearpage`: please give keep them clear of such places.

`\@kludgeins` The insert which makes T<sub>E</sub>X do a lot of the necessary work. All we need to put into it is the amount by which the pagegoal should be changed.

```

2428 \newinsert \@kludgeins
2429 \global\dimen\@kludgeins \maxdimen
2430 \global\count\@kludgeins 1000

```

(End of definition for \@kludgeins.)

`\enlargethispage` The user command.

```

\enlargethispage* 2431 \gdef \enlargethispage {%
2432     \ifstar
2433     {%
2434     <*trace>
2435         \fl@trace{Enlarging page height * }%
2436     </trace>
2437         \@enlargepage{\hbox{\kern\p@}}}%
2438     {%
2439     <*trace>
2440         \fl@trace{Enlarging page height exactly---}%
2441     </trace>
2442         \@enlargepage\@empty}%
2443     }

```

(End of definition for \enlargethispage and \enlargethispage\*.)

`\@enlargepage` This actually inserts the insert, after checking for extreme values of the change.

```

2444 \gdef\@enlargepage#1#2{%
2445   \ifdim \f@l@trace\@spaces\@spaces by #2}%
2446 \fi
2447 \ifdim \f@l@trace\@spaces\@spaces by #2}%
2448 \ifdim \f@l@trace\@spaces\@spaces by #2}%
2449 \ifdim \f@l@trace\@spaces\@spaces by #2}%
2450 \ifdim \f@l@trace\@spaces\@spaces by #2}%
2451 \ifdim \f@l@trace\@spaces\@spaces by #2}%
2452 \ifdim \f@l@trace\@spaces\@spaces by #2}%
2453 \else
2454   \ifdim \f@l@trace\@spaces\@spaces by #2}%
2455 \fi
2456 \ifdim \f@l@trace\@spaces\@spaces by #2}%
2457 \ifdim \f@l@trace\@spaces\@spaces by #2}%
2458 \ifdim \f@l@trace\@spaces\@spaces by #2}%
2459 \ifdim \f@l@trace\@spaces\@spaces by #2}%
2460 \ifdim \f@l@trace\@spaces\@spaces by #2}%

```

This next bit is for tracing only:

```

2461 \ifdim \f@l@trace\@spaces\@spaces by #2}%
2462 \ifdim \f@l@trace\@spaces\@spaces by #2}%
2463 \ifdim \f@l@trace\@spaces\@spaces by #2}%
2464 \ifdim \f@l@trace\@spaces\@spaces by #2}%
2465 \ifdim \f@l@trace\@spaces\@spaces by #2}%
2466 \ifdim \f@l@trace\@spaces\@spaces by #2}%
2467 \ifdim \f@l@trace\@spaces\@spaces by #2}%
2468 \ifdim \f@l@trace\@spaces\@spaces by #2}%
2469 \ifdim \f@l@trace\@spaces\@spaces by #2}%
2470 \ifdim \f@l@trace\@spaces\@spaces by #2}%
2471 \ifdim \f@l@trace\@spaces\@spaces by #2}%

```

*(End of definition for \@enlargepage.)*

`\ShowFloat` This command provides some information about the contents of a float register. Float registers have internal names of the form `\bx@<Uppercase-letter(s)-or numbers>` and you specify just this letter or letters as the argument, e.g., `\ShowFloat{A}`. (There is not much error recovery if you specify something that isn't a float.)

```

2472 \ifdim \f@l@trace\@spaces\@spaces by #2}%
2473 \ifdim \f@l@trace\@spaces\@spaces by #2}%
2474 \ifdim \f@l@trace\@spaces\@spaces by #2}%
2475 \ifdim \f@l@trace\@spaces\@spaces by #2}%
2476 \ifdim \f@l@trace\@spaces\@spaces by #2}%
2477 \ifdim \f@l@trace\@spaces\@spaces by #2}%
2478 \ifdim \f@l@trace\@spaces\@spaces by #2}%
2479 \ifdim \f@l@trace\@spaces\@spaces by #2}%
2480 \ifdim \f@l@trace\@spaces\@spaces by #2}%
2481 \ifdim \f@l@trace\@spaces\@spaces by #2}%
2482 \ifdim \f@l@trace\@spaces\@spaces by #2}%
2483 \ifdim \f@l@trace\@spaces\@spaces by #2}%
2484 \ifdim \f@l@trace\@spaces\@spaces by #2}%
2485 \ifdim \f@l@trace\@spaces\@spaces by #2}%
2486 \ifdim \f@l@trace\@spaces\@spaces by #2}%
2487 \ifdim \f@l@trace\@spaces\@spaces by #2}%

```

```

2488 \fl@traceval{\ht#1}%
2489 \fl@traceval{\dp#1}%
2490 \fl@traceval{\wd#1}%
2491 {\tracingonline1\showboxbreadth10\showboxdepth3\showbox#1}%
2492 }

```

Here are two definitions from `fltrace` that make the above code work:

```

2493 \def \fl@traceval #1{\fl@trace{\string #1 = \the #1}}
2494 \def \fl@tracemessage #1{{\let\@elt\@empty\typeout{LaTeX2e: #1}}}
2495 </2ekernel|latexrelease>
2496 <latexrelease>\EndIncludeInRelease
2497 <latexrelease>\IncludeInRelease{0000/00/00}%
2498 <latexrelease> \ShowFloat{Show float register contents}%
2499 <latexrelease>
2500 <latexrelease>\let\ShowFloat\@undefined
2501 <latexrelease>\let\fl@ShowFloat\@undefined
2502 <latexrelease>\let\fl@traceval\@undefined
2503 <latexrelease>\let\fl@tracemessage\@undefined
2504 <latexrelease>\EndIncludeInRelease

```

*(End of definition for \ShowFloat.)*

### 2.2.3 Float control

This part implements controllable floats and other changes to the float mechanism.

It provides, at the document level, the following command for inclusion in `LATEX2e`.

`\suppressfloats`

This suppresses all further floats on the current page.

With an optional argument it suppresses only floats only in certain positions on the current page.

[t] suppresses only floats at the top of the page [b] suppresses only floats at the bottom of the page

It also enables the use of an extra specifier, `!`, in the location optional argument of a float. If this is present then, just for this particular float, whenever it is processed by the float mechanism the following are ignored:

- all restrictions on the number of floats which can appear;
- all explicit restrictions on the amount of space which should (not) be occupied by floats and/or text.

The mechanism will still attempt to ensure that pages are not overfull.

These specifiers override, for the single float, the suppression commands described above.

In its current form, it also supplies a reasonably exhaustive, and somewhat baroque, means of tracing some aspects of the float mechanism.

More tracing.

```

\fl@trace Set-up tracing for floats independent of other tracing as it produces mega-output. Default
\tracefloatsoff is no tracing.
\tracefloats
\fl@traceval
\tracefloatvals
\fl@tracemessage
2505 <*\fltrace>
2506 \def \fl@tracemessage #1{\let\@elt\@empty\typeout{LaTeX2e: #1}}

2550 \fl@traceval\@toproom
2551 \fl@traceval\@botnum
2552 \fl@traceval\@botroom
2553 \fl@traceval\@fpmin
2554 \fl@trace{\string\textfraction = \textfraction}%
2555 \fl@traceval\@dbltopnum
2556 \fl@traceval\@dbltoproom
2557 \fl@trace{\string\textfraction = \textfraction}%
2558 \fl@trace{toplist: \@toplist}%
2559 \fl@trace{botlist: \@botlist}%
2560 \fl@trace{midlist: \@midlist}%
2561 \fl@trace{deferlist: \@deferlist}%
2562 \fl@trace{dbltoplist: \@dbltoplist}%
2563 % next line only in old releases
2564 \fl@trace{dbldeferlist: \@dbldeferlist}%
2565 \endgroup
2566 }
2567 \EndIncludeInRelease

```

We need to make sure that `fltrace` comes before `flafter` to make the tracing work.

```

2568 \@ifpackageloaded{flafter}
2569 {
2570   \PackageWarningNoLine
2571     {fltrace}{Load 'fltrace' before 'flafter'\MessageBreak
                Attempting to recover by reloading 'flafter'}%

```

Hide the fact that `flafter` was already loaded and then request it anew.

```

2572 \expandafter\let\csname ver@flafter.sty\endcsname\relax
2573 \def\reserved@a#1{%
2574   \expandafter\let\csname string#1+flafter+IIR\endcsname\relax}%
2575 \reserved@a\@addtocurcol
2576 \reserved@a\@addtonextcol
2577 \RequirePackage{flafter}}{}
2578 </fltrace>

```

As the code for `flafter` will contain tracing calls so that it works in conjunction with `fltrace` we need to provide a dummy definition for `\fl@trace` in that package.

```

2579 <flafter>
2580 \providecommand\fl@trace[1]{}
2581 </flafter>

```

*(End of definition for \fl@trace and others.)*

`\suppressfloats` Float suppression commands: these set the relevant counter globally to zero. Thus they  
`\@flstop` are overridden for a particular float by an `!` specifier.

```

2582 <*2kernel>
2583 \def \suppressfloats {%
2584   \@ifnextchar [%
2585     \@flstop
2586     {\global \@colnum \z@}%
2587   }

```

Maybe this should be a loop over `#1`?

```

2588 \def \@flstop [#1]{%
2589   \if t#1%

```

```

2590     \global \@topnum \z@
2591   \fi
2592   \if b#1%
2593     \global \@botnum \z@
2594   \fi
2595 }

```

*(End of definition for \suppressfloats and \flstop.)*

Manipulation of float placement and type; both their strings and the corresponding count registers.

**\@fpstype** First a new count register to go with **\@currtype**.  
**\@reqcolroom** Then a new skip register, for information needed to remove the **\@maxsep** conservatism: it is possible that this could use a temporary register.  
**\@textfloatsheight**

Finally a dimension register to hold the total height of in-text floats on the current page. This is needed to implement a major change in the functionality of **\@addtocurcol** which is, nevertheless, a bug fix. It is not local and therefore cannot be a temporary register.

```

2596 \newcount \@fpstype
2597 \newdimen \@reqcolroom
2598 \newdimen \@textfloatsheight

```

*(End of definition for \@fpstype, \@reqcolroom, and \@textfloatsheight.)*

**\saved@reqcolroom** Saved value of **\@reqcolroom**; this is needed when making several tests.

```

2599 \</2ekernel>
2600 \<*2ekernel | latexrelease>
2601 \<latexrelease>\IncludeInRelease{2025/06/01}%
2602 \<latexrelease>          {\saved@reqcolroom}{float placement calculation}%
2603 \newdimen \saved@reqcolroom
2604 \</2ekernel | latexrelease>
2605 \<latexrelease>\EndIncludeInRelease
2606 \<latexrelease>\IncludeInRelease{0000/00/00}%
2607 \<latexrelease>          {\saved@reqcolroom}{float placement calculation}%
2608 \<latexrelease>\let \saved@reqcolroom \@undefined
2609 \<latexrelease>\EndIncludeInRelease

```

*(End of definition for \saved@reqcolroom.)*

**\@fpsadddefault** Adds the default placement to what is already there.

Should not need to change this, but could do it as follows:

```

def \@fpsadddefault {%
  \@temptokena \expandafter\expandafter\expandafter
    {\csname fps@\@capytype \endcsname}%
  \edef \reserved@a {\the\@temptokena}%
  \@onelevel@sanitize \reserved@a
  \edef \@fps {\@fps\reserved@a}%
}

```

```

2610 <*2ekernel| fltrace>
2611 \def \@fpsadddefault {%
2612 <*trace>
2613   \fl@trace{fps changed from: \@fps}%
2614 </trace>
2615   \edef \@fps {\@fps\csname fps@\@capytype \endcsname}%
2616   \@latex@warning {%
2617     No positions in optional float specifier.\MessageBreak
2618     Default added (so using ‘\@fps’)}%
2619 }

```

*(End of definition for \@fpsadddefault.)*

**\@setfloattypecounts** Sets counters \@fpstype and \@currtype.

BANG == bit4 of \count\@currbox = 0.

```

2620 \def \@setfloattypecounts {%
2621   \@currtype \count\@currbox
2622   \@fpstype \count\@currbox
2623   \divide\@currtype\@xxxii \multiply\@currtype\@xxxii
2624   \advance \@fpstype -\@currtype
2625 <*trace>

2643     \fi
2644     \fl@trace{ORD float}%
2645   \fi
2646 </trace>
2647 }
2648 </2ekernel| fltrace>

```

*(End of definition for \@setfloattypecounts.)*

Macros for getting, testing and setting bits of the fps.

**\@getfpsbit** Sets \@tempcnta to required bit of \count\@currbox.

```

2649 <*2ekernel>
2650 \def \@getfpsbit {%
2651   \@boxfpsbit \@currbox
2652 }

```

*(End of definition for \@getfpsbit.)*

`\@boxfpsbit` Used above.

```
2653 \def \@boxfpsbit #1#2{%  
2654     \@tempcnta \count#1%  
2655     \divide \@tempcnta #2\relax  
2656 }
```

*(End of definition for \@boxfpsbit.)*

`\@testfp` New definition of the float page test.

```
2657 \def \@testfp #1{%  
2658     \@boxfpsbit #18\relax % Really ‘#1 8’ for human readers!  
2659     \ifodd \@tempcnta  
2660     \else  
2661     \@testtrue  
2662     \fi  
2663 }
```

*(End of definition for \@testfp.)*

`\@setfpsbit` Sets required bit of `\@tempcnta` (to 1).

```
2664 \def \@setfpsbit #1{%  
2665     \@tempcntb \@tempcnta  
2666     \divide \@tempcntb #1\relax  
2667     \ifodd \@tempcntb  
2668     \else  
2669     \advance \@tempcnta #1\relax  
2670     \fi  
2671 }  
2672 </2ekernel>
```

*(End of definition for \@setfpsbit.)*

`\@resethfps` Globally adds `t` as a possible location for an `h` or `!h` only placement: this must be done using the count.

Although it will leave `\@fpstype` set to 17 even if it was originally 1, this does not matter since it is the last thing in `\@addtocurcol`.

```
2673 < *2ekernel | fltrace>  
2674 \def \@resethfps {%  
2675     \let\reserved@a\@empty  
2676     \ifnum \@fpstype=\@ne  
2677     \def \reserved@a {!}%  
2678     \@fpstype 17  
2679     \fi  
2680     \ifnum \@fpstype=17  
2681     \global \advance \count\@currbox \tw@  
2682     \@latex@warning@no@line {%  
2683         ‘\reserved@a h’ float specifier changed to ‘\reserved@a ht’}%  
2684 < *trace>  
2685     \fl@trace{%  
2686         ‘t’ added to ‘\reserved@a h’- new Count: \the \count\@currbox}%  
2687 </trace>  
2688     \fi  
2689 }
```

(End of definition for \@resetfps.)  
Special stuff for BANG floats.

\@flsetnum Ignores any zero float counter value in case BANG.

It uses a local assignment to the normally global counter: a bit naughty, perhaps?

These assignments are safe so long as the counter involved is only consulted once (i.e. only for the ‘bang float’) with the changed value. This is the case within \@addtocurcol because it is used only once within a call of the output routine (which forms a group).

For \@addtonextcol this is achieved by putting a group around its code; this is needed because it is called (by \@startcolumn) for each float which was on the deferlist. Almost identical considerations pertain to \@addtodblcol. There may be more efficient ways to handle this, but the group seems to be the simplest.

```

2690 \def \@flsetnum #1{%
2691   \*trace
2692     \fl@trace{fpstype: \the \@fpstype (flsetnum \string#1)}%

Interesting facts about float mechanisms past and present, together with a summary of various features, some unresolved:

1. The value `\textfraction` does not affect the processing of doublecol floats: this seems sensible, but should be documented.
2. `\twocolumn` floatplacement was wrong: dbl not needed, ord needed.
3. `\@floatplacement` was not called after `\@startdblcol` or `\@topnewpage`. This has been changed; it is clearly a bug fix.
4. The use `\@topnewpage` when `\dblfigrule` is non-trivial produced a rule in the wrong place. This has been fixed by not using `\dblfigrule` when processing the ‘float’ from `\@topnewpage`.
5. If the specifier was just h and the float could not be put here, it went on the deferlist and stayed there until a clearpage. It now gets changed to a ‘th’: this is only an error-recovery action, putting just h or !h should be deprecated.
6. `\@dblmaxsep` was ‘the maximum of `\dblfloatsep` and `\dbltextfloatsep`’. But it was never used! Now gone completely, like `\@maxsep`.
7. After an h float is put on a page, it was counted as text when applying the `\textfraction` test; this is possibly too big a change although it is a bug fix?
8. Two consecutive h floats are separated by twice `\intertextsep`: this could be changed to one by use of `\addvspace`, OK? Note that it would also mean that less space is put in if an h float immediately follows other spaces. This is also possibly too big a change, at least for compatibility mode? Or it may be simply wrong! It has not been changed.
9. Now `\@addtocurcol` checks first for just p fps. I think that this is an increase in efficiency, but maybe the coding should be made even more efficient.
10. `\@tryfcolumn` now tests if the list is empty first, otherwise lots of wasted time! Thus this test has been removed from `\@startcolumn`. As Frank pointed out, this makes `\@startcolumn` less efficient. But it is now the same as `\@startdblcolumn`: I can see no reason why they should be different, but which is best?

11. Why is `\@colroom` set in `\@docclearpage`?
12. Footnotes. Check what `\clearpage` does when footnotes are left over. Footnotes are not put on float pages and, also, `\@addtonextcol` ignores the existence of held-over footnotes in deciding what floats can go on the page. Not changed.
13. `\clearpage` can still lose non-boxes, at least when floats are involved. It also moves some to the ‘wrong page’, but this may be a coding problem.
14. The `!` option makes it necessary to check in `\output` that there is enough room left on the page after adding a float. (This would have been necessary anyway if anyone set `\@textmin` too close to zero! A similar danger existed also if the text in a `\twocolumn[text]` entity gets too large.) The current implementation of this also makes the normal case a little less efficient, OK? Not enough room means, at present, less than `\baselineskip`, with a warning: is this OK? Should it be made generic (another parameter)?
15. There are four possibilities for supporting this:  
`\twocolumn[\maketitle more text]`  
 One is to change `\maketitle` slightly to allow this. Another is to change `\@topnewpage` so that more than one `\twocolumn[]` command is allowed; in this case `\maketitle\twocolumn[more text]` will work. The former is more robust from the user’s viewpoint, but makes the code for `\maketitle` rather ad hoc (maybe it is already?). Another is to misuse the global `twocolumn` flag locally within `\@topnewpage`. Yet another is to move the column count register from the `multicol` package into the kernel. This has been done.
16. Where should the reinserts be put to maximise the probability that footnotes come out on the correct page? Or should we go for as much compatibility as possible (but see next item)?
17. Should we continue to support (as much as possible) `\samepage`? Some of its intended functionality is now advertised as being provided by `\enlargethispage`. Use of either is likely to result in wrongly placed footnotes, marginals, etc. Which should have priority: obeying the pagination instructions, or correct placement of notes/marginalia?
18. Is the adjustment of space to cause shrinking in the kludge-\* case correct? Should it be limited to 0pt?
19. Is the setting of `\boxmaxdepth` in `makecol` and friends needed? It only has any effect if `\@textbottom` ends with a box or rule, in which case the `vskip` to allow for its depth should also be added. If it is kept, it should probably be the last thing in the box. It has now been removed.  
  
 It would perhaps be better to document that `\@textbottom` and `\@texttop` must have natural height 0pt.
20. I cannot see why the `vskip` adjustment for the depth is needed if `boxmaxdepth` is used to ensure that there is never a too deep box.
21. The value of `\boxmaxdepth` should be explicitly set whenever necessary: it is too risky to assume that it has any particular value. Care is needed in deciding what to set it to.

It is interesting to note that the value of `\boxmaxdepth` is unique in being read before the local settings for the box group are reset; all other parameter settings which affect the box construction use their values outside the box group.

22. Should `\@maxdepth` store the setting of `\maxdepth` from `lplain`? Or should we provide a proper interface to class files for setting these?

An analysis of various other macros.

`\@opcol` should do `\@floatplacement`, but where? Right at the end, since it always occurs at the start of a column.

```
\def\@opcol{%
  % Why is this done first?
  \global \@mparbottom \z@
  \if@twocolumn
    \@outputdblcol
  \else
    \@outputpage
    % This is not needed since it is done at the end of
    %   |\@outputpage|:
    \global \@colht \textheight
  \fi}
```

Only tracing has been added to these.

```

This will line up the last baselines in the two columns provided they are constructed in the normal way: i.e. ending in a skip of minus the original depth, with `\@textbottom` adding nothing.

Thus again it is essential for `\@textbottom` to have depth 0pt.

## 2.2.4 Float placement parameters

The main purpose of this section is to ensure that all the float-placement parameters which need to be set in a class file or package have been declared. It also describes their use and sets values for them which are reasonable for typical documents using US letter or A4 sized paper.

### Limits for the placement of floating objects

**\c@topnumber** This counter holds the maximum number of floats that can appear at the top of a text page or column.

```

2988 <*2ekernel>
2989 \newcount\c@topnumber
2990 \setcounter{topnumber}{2}

```

(End of definition for `\c@topnumber`.)

**\topfraction** This macro holds the maximum proportion (as a decimal number) of a text page or column that can be occupied by floats at the top.

```

2991 \newcommand\topfraction{.7}

```

*(End of definition for \topfraction.)*

**\c@bottomnumber** This counter holds the maximum number of floats that can appear at the bottom of a text page or column.

2992 `\newcount\c@bottomnumber`

2993 `\setcounter{bottomnumber}{1}`

*(End of definition for \c@bottomnumber.)*

**\bottomfraction** This macro holds the maximum proportion (as a decimal number) of a text page or column that can be occupied by floats at the bottom.

2994 `\newcommand\bottomfraction{.3}`

*(End of definition for \bottomfraction.)*

**\c@totalnumber** This counter holds the maximum number of floats that can appear on any text page or column.

2995 `\newcount\c@totalnumber`

2996 `\setcounter{totalnumber}{3}`

*(End of definition for \c@totalnumber.)*

**\textfraction** This macro holds the minimum proportion (as a decimal number) of a text page or column that must be occupied by text.

2997 `\newcommand\textfraction{.2}`

*(End of definition for \textfraction.)*

**\floatpagefraction** This macro holds the minimum proportion (as a decimal number) of a page or column that must be occupied by floating objects before a ‘float page’ is produced.

2998 `\newcommand\floatpagefraction{.5}`

*(End of definition for \floatpagefraction.)*

**\c@dbltopnumber** This counter holds the maximum number of double-column floats that can appear on the top of a two-column text page.

2999 `\newcount\c@dbltopnumber`

3000 `\setcounter{dbltopnumber}{2}`

*(End of definition for \c@dbltopnumber.)*

**\dbltopfraction** This macro holds the maximum proportion (as a decimal number) of a two-column text page that can be occupied by double-column floats at the top.

3001 `\newcommand\dbltopfraction{.7}`

*(End of definition for \dbltopfraction.)*

**\dblfloatpagefraction** This macro holds the minimum proportion (as a decimal number) of a page that must be occupied by double-column floating objects before a ‘double-column float page’ is produced.

3002 `\newcommand\dblfloatpagefraction{.5}`

*(End of definition for \dblfloatpagefraction.)*

## Floats on a text page

`\floatsep`  
`\textfloatsep`  
`\intextsep` When a floating object is placed on a page with text, these parameters control the separation between the float and the other objects on the page. These parameters are used for both one-column mode and single-column floats in two-column mode. They are all rubber lengths.

`\floatsep` is the space between adjacent floats that are placed at the top or bottom of the text page or column.

`\textfloatsep` is the space between the main text and floats at the top or bottom of the page or column.

`\intextsep` is the space between in-text floats and the text.

```
3003 \newskip\floatsep
3004 \newskip\textfloatsep
3005 \newskip\intextsep
3006 \setlength\floatsep {12\p@ \@plus 2\p@ \@minus 2\p@}
3007 \setlength\textfloatsep{20\p@ \@plus 2\p@ \@minus 4\p@}
3008 \setlength\intextsep {12\p@ \@plus 2\p@ \@minus 2\p@}
```

*(End of definition for `\floatsep`, `\textfloatsep`, and `\intextsep`.)*

`\dblfloatsep`  
`\dbltextfloatsep` When double-column floats (floating objects that span the whole `\textwidth`) are placed at the top of a text page in two-column mode, the separation between the float and the text is controlled by `\dblfloatsep` and `\dbltextfloatsep`. They are rubber lengths.

`\dblfloatsep` is the space between adjacent double-column floats placed at the top of the text page.

`\dbltextfloatsep` is the space between the main text and double-column floats at the top of the page.

```
3009 \newskip\dblfloatsep
3010 \newskip\dbltextfloatsep
3011 \setlength\dblfloatsep {12\p@ \@plus 2\p@ \@minus 2\p@}
3012 \setlength\dbltextfloatsep{20\p@ \@plus 2\p@ \@minus 4\p@}
```

*(End of definition for `\dblfloatsep` and `\dbltextfloatsep`.)*

## Floats on their own page or column

`\@fptop`  
`\@fpsep`  
`\@fpbot` When floating objects are placed on a separate page or column, called a ‘float page’, the layout of the page is controlled by these parameters, which are rubber lengths.

At the top of the page `\@fptop` is inserted; typically this supplies some stretchable whitespace. At the bottom of the page `\@fpbot` is inserted. Between adjacent floats `\@fpsep` is inserted.

These parameters are used for all floating objects on a ‘float page’ in one-column mode, and for single-column floats in two-column mode.

Note that at least one of the two parameters `\@fptop` and `\@fpbot` should contain a `plus ...fil` so as to fill the remaining empty space.

```
3013 \newskip\@fptop
3014 \newskip\@fpsep
3015 \newskip\@fpbot
3016 \setlength\@fptop{0\p@ \@plus 1fil}
3017 \setlength\@fpsep{8\p@ \@plus 2fil}
3018 \setlength\@fpbot{0\p@ \@plus 1fil}
```

*(End of definition for `\@fptop`, `\@fpsep`, and `\@fpbot`.)*

`\@dblftop` Double-column ‘float pages’ in two-column mode use similar parameters.

`\@dblpsep` 3019 `\newskip\@dblftop`

`\@dblpbot` 3020 `\newskip\@dblpsep`

3021 `\newskip\@dblpbot`

3022 `\setlength\@dblftop{0\p@ \@plus 1fil}`

3023 `\setlength\@dblpsep{8\p@ \@plus 2fil}`

3024 `\setlength\@dblpbot{0\p@ \@plus 1fil}`

*(End of definition for \@dblftop, \@dblpsep, and \@dblpbot.)*

`\topfigrule` The macros can be used to put in rules between floats and text; whatever they insert

`\botfigrule` should be vertical mode material which takes up zero space.

`\dblfigrule` 3025 `\let\topfigrule=\relax`

3026 `\let\botfigrule=\relax`

3027 `\let\dblfigrule=\relax`

3028 `\</2ekernel>`

*(End of definition for \topfigrule, \botfigrule, and \dblfigrule.)*

## 1 General support for tagged output

\SuspendTagging

\ResumeTagging

\tag\_suspend:n

\tag\_resume:n

There are places in code where it is important to stop any tagging activities, e.g., when we are doing trial typesetting that it is done several times. In such a case one must tag only the final version that is actually used, otherwise tagging structures are generated which then do not end up in the PDF and confuse the mechanism. For this we have two commands that can be used in packages: `\SuspendTagging` and `\ResumeTagging` (with corresponding L3 programming layer commands). They are available as part of the L<sup>A</sup>T<sub>E</sub>X kernel, so that they can be safely used in packages whether or not tagging is requested. They all take a string argument that is used for debugging to easily identify why tagging was suspended or restarted, for example, in `tabularx` you find `\SuspendTagging{tabularx}`. By default these four commands do nothing.

The argument is used literally (in `\typeout` messages) without any expansion when debugging is turned on and otherwise it is not used at all. This means it is safe to write something like `\SuspendTagging{\foo}` or even `\SuspendTagging\foo` which means L<sup>A</sup>T<sub>E</sub>X has to parse only a single token instead of putting a string of characters into the argument. This means a tiny speed improvement but with many such debugging strings...

\NewTaggingSocket

\NewTaggingSocketPlug

\AssignTaggingSocketPlug

Tagging sockets are implemented as normal sockets but with a name that starts with `tagsupport/` and some special conventions how their arguments (if any) are to be interpreted. This means in principle one can use the standard socket commands, which is what we started out with.

However, providing dedicated declaration commands is more convenient and helps in keeping the interfaces clearer and simpler, e.g., `\NewTaggingSocket` not only declares the socket but also automatically sets up necessary plugs and assigns a suitable default plug when tagging is not enabled.

`\NewTaggingSocketPlug` and `\AssignTaggingSocketPlug` on the other hand are mainly syntactic sugar and do nothing more than adding the `tagsupport/` to the socket name behind the scenes.

\UseTaggingSocket

\tag\_socket\_use:n

\tag\_socket\_use:nn

\tag\_socket\_use:nnn

Given that we sometimes have to suspend tagging, it would be fairly inefficient to put different plugs into these sockets whenever that happens. We therefore offer `\UseTaggingSocket` which is like `\UseSocket` except that it expects a socket starting with `tagsupport/` but the socket name is specified without this prefix, i.e.,

`\UseTaggingSocket{foo} → \UseSocket{tagsupport/foo}`

Beside being slightly shorter, the big advantage is that this way we can change `\UseTaggingSocket` to do nothing by switching a boolean instead of changing the plugs of the tagging support sockets back and forth.

Usually, these sockets have (beside the default plug defined for every socket) one additional plug defined and directly assigned. This plug is used when tagging is active. There may be more plugs, e.g., tagging with special debugging or special behavior depending on the class or PDF version etc., but right now it is usually just on or off.

When tagging is suspended they all have the same predefined behavior: The sockets with zero arguments do nothing. The sockets with one argument gobble their argument. The sockets with two arguments will drop their first argument and pass the second unchanged.

It is possible to use the tagging support sockets with `\UseSocket` directly, but in this case the socket remains active if `\SuspendTagging` is in force. There may be reasons for doing that but in general we expect to always use `\UseTaggingSocket`.

`\UseExpandableTaggingSocket` For special cases like in some `\halign` contexts we need a fully expandable version of the command. For these cases, `\UseExpandableTaggingSocket` can be used. To allow being expandable, it does not output any debugging information if `\DebugSocketsOn` is in effect and therefore should be avoided whenever possible.

The L3 programming layer versions `\tag_socket_use_expandable:n`, `\tag_socket_use:n`, `\tag_socket_use:nn`, and `\tag_socket_use:nnn` are slightly more efficient than `\UseTaggingSocket` because they do not have to determine how many arguments the socket takes when disabling it.

`\MathCollectTrue` The tagging of math has to collect/grab the math first. This is not wanted for all uses of `$`. These command allow to control the behavior of the math shift token. Without `\MathCollectFalse` the math tagging code they do nothing. Their behavior with the math tagging code is documented in `latex-lab-math.pdf`

`\MathMLintent` These two commands take two arguments. The first argument is the value of the `\MathMLarg` `intent` or `arg` attribute to be added to the MathML generated by the term in the second argument. By default the commands are no-op and discard the first argument and expand to the second. If `luamml` is loaded via the math tagging code, then these commands are redefined. They could also potentially be used by other `TEX` to MathML convertors to control the generated MathML.

`\NewStructureName` Structure elements in a document can use as tag a name from the standard PDF namespaces like `Sect`, `H1` or `Figure` but they can also use new names (which then must be rolemapped to a standard name). The second option is useful for three reasons:

- It looks nicer, if, e.g., a bible uses tag names like `Testament` or `Chapter` or `Book` instead of `Sect`.
- It is possible to formulate additional constraint on such structures in a Schema and thus ensure that there is no `Testament` inside a `Book`, something that can not be done if `Sect` is used everywhere.
- We can provide a uniform LaTeX set of names for tags.

To make it possible to adapt the tag names of a structure in document, the tag name should be stored in a command. These three commands offer an interface to declare, use and reassign such symbolic structure names. `\NewStructureName` takes one argument and declares the internal command, initially its value is `NonStruct`. The expandable command `\UseStructureName` takes one argument and allows to use the stored value. `\AssignStructureRole` takes two arguments. The first is a symbolic structure names, the second a role which should be a simply string allowed as a tag name. When the tagging code is loaded `\AssignStructureRole` is redefined to setup the rolemapping, see the description in `latex-lab-namespace.dtx`. There is also a description of the naming scheme and a list of the already predeclared names.

## 2 Implementation

`\tag_suspend:n` In the kernel, these commands get dummy definitions so that they can be used without harm in packages. The real definition is used when tagging gets enabled.

`\tag_resume:n`

`\SuspendTagging`     3 `\cs_new_eq:NN \tag_suspend:n \use_none:n`

`\ResumeTagging`     4 `\cs_new_eq:NN \tag_resume:n \use_none:n`

5 `\cs_new_protected:Npn \SuspendTagging #1 { \tag_suspend:n {#1} }`

6 `\cs_new_protected:Npn \ResumeTagging #1 { \tag_resume:n {#1} }`

*(End of definition for \tag\_suspend:n and others.)*

`\NewTaggingSocket` Initialize a new tagging socket and assign it a suitable plug.

```
7 \cs_new_protected:Npn \NewTaggingSocket #1 #2 {
8   \socket_new:nn { tagsupport / #1 } { #2 }
9   \int_case:nnF
10     { #2 }
11     {
12       0 \prg_do_nothing:
13       1 { \socket_assign_plug:nn { tagsupport / #1 } { noop } }
```

Tagging sockets with two arguments use a special **transparent** plug that just passes the second argument. Its already assigned so we only have to alter it.

```
14       2 { \socket_new_plug:nnn { tagsupport / #1 } { transparent }
15           { ##2 }
16           \socket_assign_plug:nn { tagsupport / #1 } { transparent } }
17     }
18     \ERRORnewtaggingsocket % that should get a proper error message
19 }
```

*(End of definition for \NewTaggingSocket.)*

```
\NewTaggingSocketPlug
\AssignTaggingSocketPlug 20 \cs_new_protected:Npn \NewTaggingSocketPlug #1 {
21   \NewSocketPlug { tagsupport/ #1 }
22 }
23 \cs_new_protected:Npn \AssignTaggingSocketPlug #1 {
24   \AssignSocketPlug { tagsupport/ #1 }
25 }
```

*(End of definition for \NewTaggingSocketPlug and \AssignTaggingSocketPlug.)*

`\tag_socket_use:n` Again this is not the final definition for the kernel; it is just a version to get going while some parts of the kernel support are still missing.

`\tag_socket_use:nn`

`\tag_socket_use:nnn`

```
26 \prg_new_conditional:Npnn \tag_if_active: { p , T , TF , F }
27 { \prg_return_false: }
```

`\tag_socket_use_expandable:n`

`\UseTaggingSocket`

`\UseExpandableTaggingSocket`

Dummy definitions in the kernel. These definitions will get updated in `tagpdf`. The default in the kernel is simply to get rid of the first argument, while the second argument is preserved if present:

```
28 \cs_new:Npn \tag_socket_use_expandable:n #1 { }
29 \cs_new_protected:Npn \tag_socket_use:n #1 { }
30 \cs_new_protected:Npn \tag_socket_use:nn #1#2 { }
31 \cs_new_protected:Npn \tag_socket_use:nnn #1#2#3 { #3 }
32 \cs_new_protected:Npn \UseTaggingSocket #1 { }
```

```

33 \int_case:nnF
34 { \int_use:c { c__socket_taggsupport/#1_args_int } }
35 {
36 0 \prg_do_nothing:
37 1 \use_none:n
38 2 \use_ii:nn

```

We do not expect tagging sockets with more than one or two arguments, so for now we only provide those.

```

39 }
40 \ERRORusetaggingsocket % that should get a proper error message
41 }

```

The same as an expandable command:

```

42 \cs_new:Npn \UseExpandableTaggingSocket #1 {
43 \int_case:nnF
44 { \int_use:c { c__socket_taggsupport/#1_args_int } }
45 {
46 0 \prg_do_nothing:
47 1 \use_none:n
48 2 \use_ii:nn
49 }
50 \ERRORusetaggingsocket % that should get a proper error message
51 }

```

*(End of definition for \tag\_socket\_use:n and others.)*

## 2.1 Math collection

The documentation is in latex-lab-math.

```

\MathCollectTrue
\MathCollectFalse
52 \cs_new_protected:Npn \MathCollectTrue{}
53 \cs_new_protected:Npn \MathCollectFalse{}

```

*(End of definition for \MathCollectTrue and \MathCollectFalse.)*

## 2.2 Tagging sockets

This collects tagging sockets that should be generally available so that they can also be used even if the tagging code is not loaded.

## 2.3 Generic sockets

These sockets are used in various places and should not be reassigned globally.

**mc** (*tag socket*) At first a generic socket to surround content with the mc-commands. The first argument can be used to pass options like **artifact**

```

54 \NewTaggingSocket{mc}{2}
55 \NewTaggingSocketPlug{mc}{kernel}
56 {
57 \tag_mc_begin:n {#1}
58 #2
59 \tag_mc_end:
60 }
61 \AssignTaggingSocketPlug{mc}{kernel}

```

**struct-mc** (*tag socket*) A socket to surround content with a structure and an mc-command. With the first argument the tag and other options can be set.

```

62 \NewTaggingSocket{struct-mc}{2}
63 \NewTaggingSocketPlug{struct-mc}{kernel}
64 {
65   \tag_struct_begin:n{#1}
66   \tag_mc_begin:n {}
67   #2
68   \tag_mc_end:
69   \tag_struct_end:
70 }
71 \AssignTaggingSocketPlug{struct-mc}{kernel}

```

### 2.3.1 Tagging support for paragraph setup

Paragraphs are tagged through the code in the para/hooks. This code is sometimes adjusted, e.g. to produce a “flattened” paragraph or to use a different tag. Sockets related to such code parts are collected here.

**\l\_\_tag\_block\_flattened\_level\_int** The block code needs to know if they are nested blockenvs inside a flattened environment. For this it uses a counter. Inside some contexts, e.g. at the begin of a minipage or a footnote this counter must be reset. We therefore define the counter here so that we can use it in the following socket.

```

72 \int_new:N \l__tag_block_flattened_level_int
(End of definition for \l__tag_block_flattened_level_int.)

```

**para/on** (*tag socket*) These sockets allow paragraph tagging to be enabled/disabled.

**para/off** (*tag socket*)

```

73 \NewTaggingSocket{para/on}{0}
74 \NewTaggingSocketPlug{para/on}{kernel}{\bool_set_true:N \l__tag_para_bool}
75 \NewTaggingSocket{para/off}{0}
76 \NewTaggingSocketPlug{para/off}{kernel}{\bool_set_false:N \l__tag_para_bool}
77 \AssignTaggingSocketPlug{para/on}{kernel}
78 \AssignTaggingSocketPlug{para/off}{kernel}

```

**para/restore** (*tag socket*) This socket restores the para related settings to their default. It should be used in places where “normal” paragraph tagging must be ensured, for example at the begin of a footnote.

```

79 \NewTaggingSocket{para/restore}{0}

```

**default** (*tag plug*)

```

80 \NewTaggingSocketPlug{para/restore}{default}
81 {
82   \tl_set:Nn \l__tag_para_main_tag_tl {\UseStructureName{para/semantic}}
83   \tl_set_eq:NN \l__tag_para_tag_tl \l__tag_para_tag_default_tl
84   \bool_set_false:N \l__tag_para_flattened_bool
85   \int_zero:N \l__tag_block_flattened_level_int
86   \bool_set_true:N \l__tag_para_bool
87 }
88 \AssignTaggingSocketPlug{para/restore}{default}

```

`para/begin` (*tag socket*) These sockets were previously defined in tagpdf. There are the main sockets to handle  
`para/end` (*tag socket*) the paragraph tagging when it is active (i.e., when `para/on` or `para/restore` was executed earlier).

```
89 \NewTaggingSocket{para/begin}{0}
90 \NewTaggingSocket{para/end}{0}
```

Until tagpdf is updated we need to provide the plain and block plugs

```
91 \NewTaggingSocketPlug{para/begin}{plain}{}
92 \NewTaggingSocketPlug{para/end}{plain}{}
93 \NewTaggingSocketPlug{para/begin}{block}{}
94 \NewTaggingSocketPlug{para/end}{block}{}
95
```

`para/semantic/begin` (*tag socket*) These sockets handle the `begin` and `end` structure. These are stored in sockets of their  
`para/semantic/end` (*tag socket*) own to be able to disable them globally.

```
96 \NewTaggingSocket{para/semantic/begin}{1}
97 \NewTaggingSocket{para/semantic/end}{1}
```

`(para/semantic/begin)` (*tag plug*) This tagging socket adds a `structure`. The argument allows to add additional commands like the command that puts the structure number of this command on a stack.

```
98 \tl_new:N \l__tag_para_attr_class_tl
99 \NewTaggingSocketPlug{para/semantic/begin}{kernel}
100 {
101   \__tag_gincr_para_main_begin_int:
102   \tag_struct_begin:n
103     {
104       tag=\l__tag_para_main_tag_tl,
105       attribute-class=\l__tag_para_main_attr_class_tl,
106     }
107   #1
108 }
```

`(para/semantic/end)` (*tag plug*) This socket should be used if a `-structure` is closed. The argument allows e.g. to add debug info.

```
109 \NewTaggingSocketPlug{para/semantic/end}{kernel}
110 {
111   #1
112   \__tag_gincr_para_main_end_int:
113   \tag_struct_end:
114 }
```

And now we assign these plugs:

```
115 \AssignTaggingSocketPlug{para/semantic/begin}{kernel}
116 \AssignTaggingSocketPlug{para/semantic/end}{kernel}
```

`kernel` (`para/begin`) (*tag plug*) This plug is similar to the block socket currently defined in tagpdf and should overwrite it.

```
117 \NewTaggingSocketPlug{para/begin}{kernel}
118 {
119   \bool_if:NT \l__tag_para_bool
120     {
121       \legacy_if:nF { @inlabel }
122     }
```

```

123     \__tag_check_typeout_v:n
124     {==>~ @endpe = \legacy_if:nTF { @endpe }{true}{false} \on@line }
125     \legacy_if:nF { @endpe }
126     {
127         \bool_if:NF \l__tag_para_flattened_bool
128         {
129             \UseTaggingSocket{para/semantic/begin}
130             { \__tag_para_main_store_struct: }
131         }
132     }
133     \__tag_gincr_para_begin_int:
134     \__tag_check_typeout_v:n {==>~increment~ P \on@line }
135     \tag_struct_begin:n
136     {
137         tag=\l__tag_para_tag_tl
138         ,attribute-class=\l__tag_para_attr_class_tl
139     }
140     \__tag_check_para_begin_show:nn {green}{\PARALABEL}
141     \tag_mc_begin:n {}
142 }
143 }
144 }

```

`kernel (para/end) (tag plug)` This socket is used at the end of paragraphs.

```

145 \NewTaggingSocketPlug{para/end}{kernel}
146 {
147     \bool_if:NT \l__tag_para_bool
148     {
149         \__tag_gincr_para_end_int:
150         \__tag_check_typeout_v:n {==>~increment~ /P \on@line }
151         \tag_mc_end:
152         \__tag_check_para_end_show:nn {red}{ }
153         \tag_struct_end:
154         \bool_if:NF \l__tag_para_flattened_bool
155         {
156             \UseTaggingSocket{para/semantic/end}{ }
157         }
158     }
159 }

```

As tagpdf is currently assigning the sockets after the block code we assign if even later (for now):

```

160 \AddToHook{package/latex-lab-testphase-sec/after}
161 {
162     \AssignTaggingSocketPlug{para/begin}{kernel}
163     \AssignTaggingSocketPlug{para/end}{kernel}
164 }

```

### 2.3.2 Tagging socket for targets

`refstepcounter (tag socket)` When tagging is active we want to track the current structure number when targets are set. This will be mostly used in `\refstepcounter` but also if targets are set manually.

```

165 \NewTaggingSocket{recordtarget}{0}

```

kernel (recordtarget) (tag plug)

```

166 %

### 2.3.3 Tagging Sockets for lists and blocks

block/list/label (tag socket) A tagging socket around the label in a list.

```

179 \NewTaggingSocket{block/list/label}{2}

```

block/recipe (tag socket) A tagging socket to set the tagging recipe.

```

180 \NewTaggingSocket{block/recipe}{1}

```

### 2.3.4 Tagging sockets for headings

Tagging headings is quite tricky. The sockets (and plugs) used by the kernel definitions often expect specially formatted arguments. For this reason some of them may not be suitable in other classes or packages. In that case additional sockets (or plugs) might be required.

sec/begin (tag socket) These two sockets should surround the whole section by a **Sect** structure. They should be suited also for classes and packages. The begin socket takes two brace groups as argument: the level and key for the structure (typically **tag=somename**), the end socket takes as argument a level.

```

181 \NewTaggingSocket{sec/begin}{1}
182 \NewTaggingSocket{sec/end}{1}

```

sec/title/begin (tag socket) These two sockets are used around display heading where the number is on a line of its own. The argument of the begin socket consists of two brace groups containing the level and the title.

```

183 \NewTaggingSocket{sec/title/begin}{1}
184 \NewTaggingSocket{sec/title/end}{0}

```

sec/title/hang (tag socket) This socket is used in headings with hanging number.

```

185 \NewTaggingSocket{sec/title/hang}{2}

```

sec/title/init (tag socket) These sockets are used by run-in heading to initialize tagging and to split heading and following text and tag the title.

```

/ttitle/runin/number (tag socket)
186 \NewTaggingSocket{sec/title/init}{1}
187 \NewTaggingSocket{sec/title/split}{0}
188 \NewTaggingSocket{sec/title/runin/number}{2}

```

sec/title/number (tag socket) This is a socket to tag the number. It takes two arguments: the level and the content.

```

189 \NewTaggingSocket{sec/title/number}{2}

```

### 2.3.5 Tagging sockets for toc

`contentsline/before` (*tag socket*) Tagging sockets at the begin and end of contentsline. They receive *all* contentsline arguments as one argument in four brace groups. The socket code should then use the parts it needs.

```
190 \NewTaggingSocket{toc/contentsline/before}{1}
191 \NewTaggingSocket{toc/contentsline/after}{1}
```

`toc/starttoc/before` (*tag socket*) Tagging sockets for the begin and end of start of `\@starttoc`. They take one argument, `toc/starttoc/after` (*tag socket*) the extension.

```
192 \NewTaggingSocket{toc/starttoc/before}{1}
193 \NewTaggingSocket{toc/starttoc/after}{1}
```

`toc/leaders/before` (*tag socket*) Tagging sockets to make the dot leaders an artifact. They do not take an argument.

`toc/leaders/after` (*tag socket*)

```
194 \NewTaggingSocket{toc/leaders/before}{0}
195 \NewTaggingSocket{toc/leaders/after}{0}
```

### 2.3.6 Tagging support for marginpar

`marginpar/begin` (*tag socket*)

`marginpar/end` (*tag socket*)

```
196 \NewTaggingSocket{marginpar/begin}{0}
197 \NewTaggingSocket{marginpar/end}{0}
```

### 2.3.7 Tagging support for table/tabular packages

The code uses a number of sockets to inject the tagging commands. These can be easily set to a noop-plug in case the automated tagging is not wanted.

`tbl/cell/begin` (*tag socket*) At first sockets for the begin and end of cells and table rows:

```
tbl/cell/end (tag socket) 198 \NewTaggingSocket{tbl/cell/begin}{0}
tbl/pcell/end (tag socket) 199 \NewTaggingSocket{tbl/cell/end}{0}
tbl/pcell/end (tag socket) 200 \NewTaggingSocket{tbl/row/begin}{0}
tbl/row/begin (tag socket) 201 \NewTaggingSocket{tbl/row/end}{0}
tbl/row/end (tag socket)
```

Multi-line cells have their own sockets (as they start out in vertical mode and need different treatment).

```
202 \NewTaggingSocket{tbl/pcell/begin}{0}
203 \NewTaggingSocket{tbl/pcell/end}{0}
```

`tbl/init` (*tag socket*) This socket should be at the begin of the table, inside a group. It is used for settings such as disabling para-tagging inside the table. This socket can perhaps be merged later into the begin-sockets.

```
204 \NewTaggingSocket{tbl/init}{0}
```

`tbl/init/celldata` (*tag socket*) This socket is used in `\tbl_init_cell_data_for_table`, the command that stores and initialize cell data to handle nested tables. It can be used to restore similar tagging related values

```
205 \NewTaggingSocket{tbl/init/celldata}{0}
```

`tbl/finalize` (*tag socket*) To fine tune the structure (change cells to header cells, remove unwanted structures, move a foot to the end, etc.). We also need a socket that is executed at the end of the table but *before* all the variables are restored to the outer or default values. The code in the socket can make assignments, but probably shouldn't do typesetting and not write whatsits.

206 `\NewTaggingSocket{tbl/finalize}{0}`

`tbl/restore/celldata` (*tag socket*) This socket is used in `\tbl_restore_outer_cell_data:`, the command that restores cell data when quitting a nested table. It can be used to restore similar tagging related values

207 `\NewTaggingSocket{tbl/restore/celldata}{0}`

`tbl/colspan` (*tag socket*) This socket is used to manage spanning cells, e.g., a `\multicolumn`. It expects one argument (the number of cells spanned) and if tagging is enabled set appropriate tag attributes in the background. We probably need a similar socket for row spans eventually.

208 `\NewTaggingSocket{tbl/colspan}{1}`

`tbl/hmode/begin` (*tag socket*) These sockets are used in the begin and end code of environments, to allow a fast enabling  
`tbl/hmode/end` (*tag socket*) and disabling of the tagging. We distinguish between tables that can be used inside  
`tbl/vmode/begin` (*tag socket*) paragraphs and standalone tables such as `longtable` that are always in vertical mode.  
`tbl/vmode/end` (*tag socket*)

209 `\NewTaggingSocket{tbl/hmode/begin}{0}`

210 `\NewTaggingSocket{tbl/hmode/end}{0}`

211 `\NewTaggingSocket{tbl/vmode/begin}{0}`

212 `\NewTaggingSocket{tbl/vmode/end}{0}`

`tbl/longtable/init` (*tag socket*) `longtable` needs its own sockets to fine tune the structure. Simply switching the plug  
`/longtable/finalize` (*tag socket*) in the previous socket interferes with enabling/disabling the tagging.

213 `\NewTaggingSocket{tbl/longtable/init}{0}`

214 `\NewTaggingSocket{tbl/longtable/finalize}{0}`

`tbl/longtable/head` (*tag socket*) Header and footer boxes need special handling because they are repeatedly used.

`tbl/longtable/foot` (*tag socket*)

215 `\NewTaggingSocket{tbl/longtable/head}{0}`

216 `\NewTaggingSocket{tbl/longtable/foot}{0}`

`tbl/leaders/begin` (*tag socket*) Sockets around leaders such as rules or dotted lines, that should be tagged as artifacts,  
`tbl/leaders/end` (*tag socket*) used, for example, in `\cline`.

217 `\NewTaggingSocket{tbl/leaders/begin}{0}`

218 `\NewTaggingSocket{tbl/leaders/end}{0}`

### 2.3.8 Tagging Support for floats

`float/hmode/begin` (*tag socket*) These sockets are used if the float is called in hmode.

`float/hmode/end` (*tag socket*)

219 `\NewTaggingSocket{float/hmode/begin}{0}`

220 `\NewTaggingSocket{float/hmode/end}{0}`

`float/begin` (*tag socket*) These sockets start and stop the float structure.

`float/end` (*tag socket*)

221 `\NewTaggingSocket{float/begin}{0}`

222 `\NewTaggingSocket{float/end}{0}`

`caption/begin` (*tag socket*) These sockets are used in `\@makecaption`. They open and close the `Caption` structure.  
`caption/end` (*tag socket*) Their default plugs assume that they are used in vmode. The argument of the begin socket is the structure number of the parent float. If it is empty the current structure number is used.

```
223 \NewTaggingSocket{caption/begin}{1}
224 \NewTaggingSocket{caption/end}{0}
```

`caption/label/begin` (*tag socket*) These sockets are used in `\@makecaption` around the label. Their default plugs ensure that the label is outside the paragraph and that the rest of the caption uses flattened para mode. If the caption is not in a hbox, the `para/begin` socket should follow to properly start the paragraph.

```
225 \NewTaggingSocket{caption/label/begin}{0}
226 \NewTaggingSocket{caption/label/end}{0}
```

## 2.4 Tagging support for output routines

`build/page/header` (*tag socket*) These sockets receive the formatted running header/footer in its second argument (the first is not used) following the convention of tagging sockets, i.e., only the second argument is processed if tagging is not active.

```
227 \NewTaggingSocket{build/page/header}{2}
228 \NewTaggingSocket{build/page/footer}{2}
```

`ld/column/outputbox` (*tag socket*) This socket is used to add any missing tagging structures to the `\@outputbox` box, if necessary.

```
229 \NewTaggingSocket{build/column/outputbox}{0}
```

`uild/column/footins` (*tag socket*) This socket is used to add any missing tagging structures to the `\footins` box, if necessary.

```
230 \NewTaggingSocket{build/column/footins}{0}
```

`page@sofar` (*tag socket*) This socket is declared and used in the multicol output routines. Only listed for reference.

```
231 %\NewTaggingSocket{page@sofar}{0}
```

## 2.5 Tagging support for math

### 2.5.1 General sockets

The following sockets are the main math sockets.

```
232 \NewTaggingSocket{math/inline/begin}{0}
233 \NewTaggingSocket{math/inline/end}{0}
234 \NewTaggingSocket{math/inline/formula/begin}{2}
235 \NewTaggingSocket{math/inline/formula/end}{0}
236 \NewTaggingSocket{math/display/begin}{0}
237 \NewTaggingSocket{math/display/end}{0}
238 \NewTaggingSocket{math/display/formula/begin}{2}
239 \NewTaggingSocket{math/display/formula/end}{0}
240 \NewTaggingSocket{math/display/tag/begin}{0}
241 \NewTaggingSocket{math/display/tag/end}{0}
```

## 2.5.2 Sockets specific for luamml

**Save sockets** These sockets are wrappers around the `\luamml_save:...` commands. They take an argument which should contain the argument of the save command.

`math/luamml/save/nn` (*tag socket*) The argument should contain the two arguments of the command.

242 `\NewTaggingSocket{math/luamml/save/nn}{1}`

`math/luamml/save/nNn` (*tag socket*) The argument should contain the three arguments of the command.

243 `\NewTaggingSocket{math/luamml/save/nNn}{1}`

### Socket to annotate

`luamml/annotate/false` (*tag socket*) This socket can be used for content that should be annotated with `core=false`

244 `\NewTaggingSocket{math/luamml/annotate/false}{2}`

**Array sockets** These sockets will be used in `array` to add luamml support to the array environment.

`math/luamml/array/save` (*tag socket*) This socket will be used in `\endarray`. The plug is set by luamml.

245 `\NewTaggingSocket{math/luamml/array/save}{0}`

`luamml/array/finalize` (*tag socket*) This socket will be used in `\endarray`. The plug is set by luamml.

246 `\NewTaggingSocket{math/luamml/array/finalize}{0}`

`luamml/array/initcol` (*tag socket*) This socket will be used in `\@classz`. The plug is set by luamml.

247 `\NewTaggingSocket{math/luamml/array/initcol}{0}`

`math/luamml/array/finalizecol` (*tag socket*) This socket will be used in `\@classz`. The plug is set by luamml. The argument sets the type of the column.

248 `\NewTaggingSocket{math/luamml/array/finalizecol}{1}`

**Alignment environments** Multiline environments like `align`, `multline` or `gather` are tagged as `mtable`.

`math/luamml/mtable/finalizecol` (*tag socket*) This socket is used at the end of alignment cells and adds them to the row. The argument passes a type like `last` or `box`.

249 `\NewTaggingSocket{math/luamml/mtable/finalizecol}{1}`

`luamml/mtable/finalize` (*tag socket*) This socket is used at the end of alignment environment to finalize the `mtable` code. It should be used normally with `\UseExpandableTaggingSocket`.

250 `\NewTaggingSocket{math/luamml/mtable/finalize}{1}`

`luamml/mtable/aligncol` (*tag socket*) This socket is used in `multline` to add attributes describing the alignment to the left and right. It takes an argument, the alignment.

251 `\NewTaggingSocket{math/luamml/mtable/aligncol}{1}`

`luamml/mtable/innertable/save` (*tag socket*) This socket is used in `\endaligned` to save the table. It takes no argument.

252 `\NewTaggingSocket{math/luamml/mtable/innertable/save}{0}`

`\le/smallmatrix/save` (*tag socket*) This socket is used in `\endsmallmatrix` to save the table. It takes no argument. TODO: Check if this socket and the innertable socket can/should be merged into a more generic version.

253 `\NewTaggingSocket{math/luamml/mtable/smallmatrix/save}{0}`

`\innertable/finalize` (*tag socket*) This socket is used e.g. in `\endsmallmatrix` and `\gathered` to finalize the table. It takes no argument.

254 `\NewTaggingSocket{math/luamml/mtable/innertable/finalize}{0}`

`\luamml/mtable/tag/save` (*tag socket*) This socket is used to save a tag for later use. has been save before.

255 `\NewTaggingSocket{math/luamml/mtable/tag/save}{0}`

`\luamml/mtable/tag/set` (*tag socket*) This socket should be used when a tag is placed. It inserts a tag that has been save before.

256 `\NewTaggingSocket{math/luamml/mtable/tag/set}{0}`

### mbox socket

`math/luamml/hbox` (*tag socket*) This socket is used around `\hbox` inside an `\mbox`, `\makebox` and `\text` and annotates the content if the `\hbox` is used inside math. The real plug is set by luamml but a default plug is defined here so that the socket can also be used if luamml is not used.

257 `\NewTaggingSocket{math/luamml/hbox}{2}`

### math phantom sockets

`math/luamml/finph@nt` (*tag socket*) This socket handles the annotation of `\finph@nt`

258 `\NewTaggingSocket{math/luamml/finph@nt}{2}`

`math/luamml/finph@nt` (*tag socket*) This socket handles the annotation of `\finsm@sh`

259 `\NewTaggingSocket{math/luamml/finsm@sh}{2}`

### Artifact root sign

`math/luamml/artifact` (*tag socket*) Unicode characters like a root sign should be marked as artifacts to avoid duplication, e.g., in derivation if mathml structure elements are used that imply the meaning.

260 `\NewTaggingSocket{math/luamml/artifact}{0}`

## 2.6 MathML intent attributes

`\MathMLintent` Stub definitions here to allow these commands to be used in packages whether or not tagging is enabled.

`\MathMLarg`

261 `\ExplSyntaxOn`

262 `\cs_new_protected:Npn\MathMLintent#1#2{#2}`

263 `\cs_new_protected:Npn\MathMLarg#1#2{#2}`

264 `\ExplSyntaxOff`

(End of definition for `\MathMLintent` and `\MathMLarg`.)

## 2.7 Symbolic structure names

`\NewStructureName` Stub definitions here to allow these commands to be used in packages whether or not the  
`\UseStructureName` tagging support code is loaded.  
`\AssignStructureRole`

```

265 <@@=tag>
266 \ExplSyntaxOn
267 \cs_new_protected:Npn\NewStructureName#1
268 {
269   \tl_new:c {l__tag_name_#1_tl}
270   \tl_set:cn {l__tag_name_#1_tl}{NonStruct}
271 }
272 \cs_new:Npn\UseStructureName#1
273 {
274   \cs:w l__tag_name_#1_tl\cs_end:
275 }
276 \cs_new_protected:Npn\AssignStructureRole#1#2
277 {
278   \tl_set:cn { l__tag_name_#1_tl }{#2}
279 }
280 \ExplSyntaxOff

```

*(End of definition for \NewStructureName, \UseStructureName, and \AssignStructureRole.)*

## 3 For lttab.dtx parked here for now

```

281 <@@=tbl>
282 \ExplSyntaxOn

```

### 3.1 Variables for row, column and span counting

This part needs a decision on names for various integer registers as well as a decision if those should be also made available for L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub>-style packages in form of 2e names and or as non-internals for the L3 programming layer.

At the moment they are all internal but this probably has to change.

`\g__tbl_col_int` `\g__tbl_row_int` holds the current row number in the table. The value 0 means we haven't yet processed the table preamble (or in case of longtable are just in front of the next chunk to be processed). It is incremented by every `\cr` including the one ending the table preamble.

TODO: due to the gymnastics needed inside the longtable code the row counter is directly exposed there rather than hidden by interfaces. This needs changing when it is decided how to manage these counters.

`\g__tbl_col_int` holds the current column number. The value 0 means we have not yet started the table or just finished a table row (with `\` typically); any other positive value means we are currently typesetting a cell in that column in some row (denoted by the `\g__tbl_row_int`).

In a `\multicolumn` it holds the column number of the first spanned column and `\g__tbl_span_tl` the info how many cells are spanned.

`\g__tbl_span_tl` is normally 1 except in a `\multicolumn` cell.

```

283 \int_new:N \g__tbl_col_int
284 \int_new:N \g__tbl_row_int
285 \tl_new:N \g__tbl_span_tl

```

```

286 \tl_new:N \g__tbl_table_cols_tl
287
288 \tl_gset:Nn \g__tbl_span_tl {1}
289 \tl_gset:Nn \g__tbl_table_cols_tl {0} % indicates outer level

```

*(End of definition for \g\_\_tbl\_col\_int and others.)*

\l\_\_tbl\_saved\_col\_tl Saving the outer values if we are nesting tables is necessary (as the above variables are globally altered). For this we always use token lists because they don't change and we do not need to blow additional integer registers.

```

290 \tl_new:N \l__tbl_saved_col_tl
291 \tl_new:N \l__tbl_saved_row_tl
292 \tl_new:N \l__tbl_saved_span_tl
293 \tl_new:N \l__tbl_saved_table_cols_tl
294
295 \tl_set:Nn \l__tbl_saved_col_tl{0}
296 \tl_set:Nn \l__tbl_saved_row_tl{0}
297 \tl_set:Nn \l__tbl_saved_span_tl{1}
298 \tl_set:Nn \l__tbl_saved_table_cols_tl{0} % indicates outer level

```

*(End of definition for \l\_\_tbl\_saved\_col\_tl and others.)*

\g\_\_tbl\_missingcells\_int This will contain the number of missing cells in a row:

```

299 \int_new:N \g__tbl_missing_cells_int

```

*(End of definition for \g\_\_tbl\_missingcells\_int.)*

## 3.2 Tracing/debugging

```

\DebugTablesOn
\DebugTablesOff
300 \def\DebugTablesOn{
301   \cs_set_eq:NN \__tbl_trace:n \typeout
302 }
303 \def\DebugTablesOff{
304   \cs_set_eq:NN \__tbl_trace:n \use_none:n
305 }
306 \cs_new_eq:NN \__tbl_trace:n \use_none:n

```

*(End of definition for \DebugTablesOn and \DebugTablesOff.)*

## 3.3 Interface commands

All interface commands for the cell number determination have to be public on some level because they are needed in other packages as well, e.g., longtable. We may or may not also want to provide 2e style names for them.

\tbl\_update\_cell\_data: Updating cell data in columns after the first means we have to increment the \g\_\_tbl\_col\_int by the span count of the previous cell (in case it was a \multicolumn) and then reset the \g\_\_tbl\_span\_tl to one (as the default).

```

307 \cs_new_protected:Npn \tbl_update_cell_data: {
308   \int_gadd:Nn \g__tbl_col_int { \g__tbl_span_tl }
309   \tl_gset:Nn \g__tbl_span_tl {1}
310 }

```

(End of definition for \tbl\_update\_cell\_data:.)

\tbl\_count\_table\_cols: Current implementation of \@mkpream uses the scratch counter \count@ to keep track of the number of toks registers it needs (2 per column), but this can't be used as it counts also insertions made with !{} and @{}. So similar as does longtable for \LT@cols we count the numbers of ampersands instead.

```

311 \cs_new:Npn \tbl_count_table_cols: {
312   \seq_set_split:NnV\l__tbl_tmpa_seq {&}\@preamble
313   \tl_gset:Ne \g__tbl_table_cols_tl { \seq_count:N \l__tbl_tmpa_seq }
314   \__tbl_trace:n { ==>~ Table~ has~ \g__tbl_table_cols_tl \space columns }
315 }

```

(End of definition for \tbl\_count\_table\_cols:.)

\l\_\_tbl\_tmpa\_seq

```

316 \seq_new:N \l__tbl_tmpa_seq

```

(End of definition for \l\_\_tbl\_tmpa\_seq.)

\tbl\_count\_missing\_cells:n We might have the situation that some table package has not implemented the \tbl\_count\_table\_cols: in which case \g\_\_tbl\_table\_cols\_tl would always be zero and we would get an error below when we try to determine the missing cells, so bypass that calculation if we aren't doing tagging (there the packages should have the proper code added). Recall that this is code, that is called by \ and an old table package might rely on whatever the L<sup>A</sup>T<sub>E</sub>X kernel offers here.

```

317 \cs_new:Npn \tbl_count_missing_cells:n #1 {
318   \tag_if_active:T {
319     \int_compare:nNnT \g__tbl_col_int > 0
320     {
321       \int_gset:Nn \g__tbl_missing_cells_int
322       {
323         \g__tbl_table_cols_tl
324         - \g__tbl_col_int
325         - \g__tbl_span_tl
326         + 1
327       }
328       \int_compare:nNnT \g__tbl_missing_cells_int < 0 \ERRORmissingcells % should not happen
329       \__tbl_trace:n{==>~
330       (#1)~
331       This~ row~ needs~
332       \int_use:N \g__tbl_missing_cells_int \space
333       additional~ cell(s)
334     }
335   }
336 }
337 }

```

(End of definition for \tbl\_count\_missing\_cells:n.)

\tbl\_init\_cell\_data\_for\_table:

```

338 \cs_new_protected:Npn \tbl_init_cell_data_for_table: {
339   \tl_set:No \l__tbl_saved_col_tl {\int_use:N \g__tbl_col_int }
340   \tl_set:No \l__tbl_saved_row_tl {\int_use:N \g__tbl_row_int }
341   \tl_set_eq:NN \l__tbl_saved_table_cols_tl \g__tbl_table_cols_tl

```

```

342 \tbl_set_eq:NN \l__tbl_saved_span_tl \g__tbl_span_tl
343 %
344 \__tbl_trace:n { ==>~ saved~cell~data:~
345             \l__tbl_saved_row_tl,
346             \l__tbl_saved_col_tl,
347             \l__tbl_saved_span_tl \space
348             (
349             \int_compare:nNnTF \l__tbl_saved_table_cols_tl = 0
350             { outer~ level }
351             { max:~ \l__tbl_saved_table_cols_tl }
352             )
353     }

```

Tagging has to initialize cell data too.

```

354 \UseTaggingSocket{tbl/init/celldata}

```

These are the initial values when starting a table:

```

355 \int_gzero:N \g__tbl_row_int
356 \int_gzero:N \g__tbl_col_int
357 \tl_gset:Nn \g__tbl_span_tl {1}
358 }

```

*(End of definition for \tbl\_init\_cell\_data\_for\_table:.)*

\tbl\_update\_cell\_data\_for\_next\_row:

```

359 \cs_new_protected:Npn \tbl_update_cell_data_for_next_row: {
360     \int_gincr:N \g__tbl_row_int           % this row about to start
361     \int_gzero:N \g__tbl_col_int          % we are before first col
362 }

```

*(End of definition for \tbl\_update\_cell\_data\_for\_next\_row:.)*

\tbl\_init\_cell\_data\_for\_row: If we start processing a cell in the first column we set \g\_\_tbl\_col\_int to 1 as we are no longer "at" but "in" the first column. We also set \g\_\_tbl\_span\_tl to its default value (not spanning cells).

```

363 \cs_new_protected:Npn \tbl_init_cell_data_for_row: {
364     \tl_gset:Nn \g__tbl_col_int {1}
365     \tl_gset:Nn \g__tbl_span_tl {1}
366 }

```

*(End of definition for \tbl\_init\_cell\_data\_for\_row:.)*

\tbl\_if\_row\_was\_started:T We use \g\_\_tbl\_col\_int equal zero to indicate that we are just after a TR (i.e. between rows or at the very beginning of the table). Using the row count is not so good as longtable may split the table in chunks.

These conditionals have to be expandable (i.e., unprotected) as they are sometimes executed when T<sub>E</sub>X is scanning inside a table.

```

367 \cs_new:Npn \tbl_if_row_was_started:T {
368     \int_compare:nNnT \g__tbl_col_int > 0
369 }
370 \cs_new:Npn \tbl_if_row_was_started:TF {
371     \int_compare:nNnTF \g__tbl_col_int > 0
372 }

```

*(End of definition for \tbl\_if\_row\_was\_started:T and \tbl\_if\_row\_was\_started:TF.)*

`\tbl_gzero_row_count:` This here is basically a temporary interface. What it will be in the end depends on what we decide concerning exposing row and column counters, if they stay internal we need something like this here (perhaps using `gincr` etc, or perhaps some other names in the first place).

```

373 \cs_new_protected:Npn \tbl_gzero_row_count: {
374   \int_gzero:N \g__tbl_row_int
375 }
376 \cs_new_protected:Npn \tbl_gincr_row_count: {
377   \int_gincr:N \g__tbl_row_int
378 }
379 \cs_new_protected:Npn \tbl_gdecr_row_count: {
380   \int_gdecr:N \g__tbl_row_int
381 }

```

*(End of definition for `\tbl_gzero_row_count:`, `\tbl_gincr_row_count:`, and `\tbl_gdecr_row_count:`.)*

`\tbl_inbetween_rows:` Again name is not really brilliant so far.

```

382 \cs_new_protected:Npn \tbl_inbetween_rows: {
383   \int_gzero:N \g__tbl_col_int
384 }

```

*(End of definition for `\tbl_inbetween_rows:`.)*

`\tbl_restore_outer_cell_data:`

```

385 \cs_new_protected:Npn \tbl_restore_outer_cell_data: {
386   \int_gset:Nn \g__tbl_col_int { \l__tbl_saved_col_tl }
387   \int_gset:Nn \g__tbl_row_int { \l__tbl_saved_row_tl }
388   \tl_gset_eq:NN \g__tbl_span_tl \l__tbl_saved_span_tl
389   \tl_gset_eq:NN \g__tbl_table_cols_tl \l__tbl_saved_table_cols_tl
390   \UseTaggingSocket{tbl/restore/celldata}
391   \__tbl_trace:n { ==>~ restored~cell~data:~
392     \int_use:N \g__tbl_row_int,
393     \int_use:N \g__tbl_col_int,
394     \l__tbl_saved_span_tl \space
395     (
396       \int_compare:nNnTF \g__tbl_table_cols_tl = 0
397         { outer~ level }
398         { max:~ \g__tbl_table_cols_tl }
399     )
400   }
401 }

```

*(End of definition for `\tbl_restore_outer_cell_data:`.)*

`\tbl_update_multicolumn_cell_data:n` This macro updates `\g__tbl_col_int` and `\g__tbl_span_tl` inside a `\multicolumn` and possibly calls the tagging socket `tbl/row/begin`.

```

402 \cs_new_protected:Npn \tbl_update_multicolumn_cell_data:n #1 {

```

We execute socket for tagging only if this `\multicolumn` replaces the preamble of the first column. In that case we also have to set `\g__tbl_col_int` to 1 because this is no longer done in the preamble for the cell either.

```

403   \int_compare:nNnTF \g__tbl_col_int = 0
404   {
405     \UseTaggingSocket{tbl/row/begin}
406     \int_gset:Nn \g__tbl_col_int {1}
407   }

```

If we are in a later column we use `\g__tbl_span_tl` from the previous column to update.

```

408     {
409       \int_gadd:Nn \g__tbl_col_int { \g__tbl_span_tl }
410     }

```

Then we set the span value so that it can be use in the next column.

```

411     \tl_gset:Nn \g__tbl_span_tl {#1}
412   }

```

*(End of definition for \tbl\_update\_multicolumn\_cell\_data:n.)*

`\tbl_crcr:n` This macro is used instead of the usual `\crcr` at the end of a table. It is deliberately defined without protection because it may get expanded by the scanning mechanism of low-level  $\TeX$  after a final `\cr` (aka `\`) in the table. In that case it shouldn't stop the expansion and the conditional inside will be false, thus it just vanishes without doing anything. If there are missing cells (in which case we also haven't see `\cr` yet) the macro `\tbl_count_missing_cells:n` is executed and then the row is finished with a final `\cr`.

```

413 \cs_new:Npn \tbl_crcr:n #1 {
414   \int_compare:nNnT \g__tbl_col_int > 0
415     {
416       \tbl_count_missing_cells:n {#1}
417     }

```

Even if we are at the start of a row we may have to do a `\cr`, so we do a `\crcr` always at the end.

```

418     \crcr
419   }

```

*(End of definition for \tbl\_crcr:n.)*

```

420 \ExplSyntaxOff
421 \@@=

```

This is needed for `longtable` because `\refstepcounter` is setting up a target when `hyperref` is loaded and we don't want that in `longtable`. Prevent `longtable` patching by `hyperref` until `hyperref` does so automatically:

```

422 \def\hyper@nopath@longtable{}

429 \<latexrelease>
430 \<latexrelease>\EndModuleRelease
431 \</2ekernel | latexrelease>

```

## File 56

# lthyphen.dtx

This file contains the code for loading hyphenation patterns into L<sup>A</sup>T<sub>E</sub>X. Most of this will end up in a file called `hyphen.ltx`. If you wish to customize your L<sup>A</sup>T<sub>E</sub>X system in respect of hyphenation patterns, write a file `hyphen.cfg`. If this file exists, it will be loaded instead of `hyphen.ltx`. See the comments below for additional information.

To produce the printed version of this file the following code is used. It can be extracted with the DOCSTRIP program, or one can run this file directly through L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub>.

```
1 <*driver>
2 \documentclass{ltxdoc}
3 \begin{document}
4 \DocInput{lthyphen.dtx}
5 \end{document}
6 </driver>
```

The default file `hyphen.ltx` loads hyphenation patterns for US english. If you want to load additional or other hyphenation patterns, you should create a file `hyphen.cfg`. This is best done by starting from `hyphen.ltx`.

For backward compatibility, the default file, `hyphen.ltx`, first tries to load the file `hyphen.tex`. If this file exists, an information message is issued and the appropriate defaults for T<sub>E</sub>X's internal parameters are set: `\language` is initialized to 0, and `\lefthyphenmin` and `\righthyphenmin` to 2 and 3, respectively, to disallow x- or -xx breaks.

```
7 <*default>
8 \InputIfFileExists{hyphen.tex}%
9   {\message{Loading hyphenation patterns for US english.}}%
10   \language=0
11   \lefthyphenmin=2 \righthyphenmin=3 }%
```

Otherwise, since we cannot do anything without any hyphenation patterns, an error message is printed and the IniT<sub>E</sub>X run is terminated by invoking `\@@end` (which is the L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub> name for T<sub>E</sub>X's `\end` primitive).

```
12   {\errhelp{The configuration for hyphenation is incorrectly
13             installed.^^J%
14             If you don't understand this error message you need
15             to seek^^Jexpert advice.}%
16   \errmessage{OOPS! I can't find any hyphenation patterns for
17             US english.^^J \space Think of getting some or the
18             latex2e setup will never succeed}\@@end}
19 </default>
```

The following example describes the possible contents of a file `hyphen.cfg` that will load both US English and German hyphenation patterns, making the former the default. It sets `\language` to 0 for the US patterns and to 1 for the German patterns. Then `\language` is set to 0 to make this the default and the default values of `\lefthyphenmin` and `\righthyphenmin` are set.

```
language=0
input hyphen % (or \input ushyphen1 if the file has been renamed)
language=1
input ghyph31
```

```
language=0
lefthyphenmin=2
righthyphenmin=3
endinput
```

Another possibility is to use the package `babel`, by Johannes Braams. That package is distributed with a suitable `hyphen.cfg` file.

## File 57

# ltxfinal.dtx

## 1 Final settings

This section contains the final settings for L<sup>A</sup>T<sub>E</sub>X. It initializes some debugging and typesetting parameters, sets the default `\catcodes` and `uc/lc` codes, and inputs the hyphenation file.

### 1.1 Debugging

By default, L<sup>A</sup>T<sub>E</sub>X shows statistics:

```
1 <*2ekernel>
2 \tracingstats1
```

### 1.2 Typesetting parameters

```
\@lowpenalty These are penalties used internally.
\@medpenalty 3 \newcount\@lowpenalty
\@highpenalty 4 \newcount\@medpenalty
5 \newcount\@highpenalty
```

*(End of definition for \@lowpenalty, \@medpenalty, and \@highpenalty.)*

```
\newmarks Allocate extended marks types if etex is active. Placed here at the end of the format to
increase compatibility with count allocations in earlier releases.
```

```
6 </2ekernel>
7 <*2ekernel | latexrelease>
8 <latexrelease>\IncludeInRelease{2015/01/01}%
9 <latexrelease>          {\newmarks}{Extended Allocation}%
10 \ifx\marks\@undefined\else
11 \def\newmarks{%
12   \e@alloc\marks \e@alloc@chardef{\count256}\m@ne\e@alloc@top}
13 \fi
14 </2ekernel | latexrelease>
15 <latexrelease>\EndIncludeInRelease
16 <latexrelease>\IncludeInRelease{0000/00/00}%
17 <latexrelease>          {\newmarks}{Extended Allocation}%
18 <latexrelease>\let\newmarks\@undefined
19 <latexrelease>\EndIncludeInRelease
20 <*2ekernel>
```

*(End of definition for \newmarks.)*

Allocate 3 mark classes to be used in `\markboth` and `\markright`. Should be done earlier but for that definition of `\newmarks` needs moving (which it should I guess).

```
21 </2ekernel>
22 <*2ekernel | latexrelease>
23 <latexrelease>\IncludeInRelease{2022/06/01}%
24 <latexrelease>          {2e-left}{Delayed legacy marks}%
25 \NewMarkClass {2e-left}
```

```

26 \NewMarkClass {2e-right}
27 \NewMarkClass {2e-right-nonempty}

```

No rollback really, the marks will remain.

```

28 </2ekernel | latexrelease>

The default values of the picture and \fbox parameters:

```

149   \unitlength = 1pt
150   \fboxsep = 3pt
151   \fboxrule = .4pt

```

The saved value of T<sub>E</sub>X's \maxdepth:

```

152   \@maxdepth      = \maxdepth

```

\vsize initialized because a \clearpage with \vsize < \topskip causes trouble. \@colroom and \@colht also initialized because \vsize may be set to them if a \clearpage is done before the \begin{document}

```

153   \vsize = 1000pt
154   \@colroom = \vsize
155   \@colht = \vsize

```

Initialise \textheight \textwidth and page style, to avoid internal errors if they are not set by the class.

```

156   \textheight=.5\maxdimen
157   \textwidth=\textheight
158   \ps@empty

```

### 1.3 Lccodes for hyphenation

For 7- and 8-bit engines the assumption of T1 encodings is the basis for the hyphenation patterns. That's not the case for the Unicode engines, where the assumption is engine-native working. The common loader system provides access to data from the Unicode Consortium covering not only `\lccode` but also other related data. The `\lccode` part of that at least needs to be loaded before hyphenation is tackled: XeTeX follows the standard TeX route of building patterns into the format. LuaTeX doesn't require this data be loaded *here* but it does need to be loaded somewhere. Rather than test for the Unicode engines by name, the approach here is to look for the extended math mode handling both provide: any other engine developed in this area will presumably also provide `\Umathcode`.

```
159 \ifnum 0%

221 <latexrelease> \fi
222 <latexrelease> \EndIncludeInRelease
223 <*2ekernel>

```

There is one over-ride that makes sense here (see below for the same for 8-bit engines): setting the lccode for - to itself.

```
224 \lccode'\- ='\- % default hyphen char
```

The alternative is that a “traditional” engine is in use.

```
225 \else
```

We set things up so that hyphenation files can assume that the default (T1) lccodes are in use (at present this also sets up the uccodes). We temporarily define `\reserved@a` to apply `\reserved@c` to all the numbers in the range of its arguments.

```

226 \def\reserved@a#1#2{%
227   \@tempcnta#1\relax
228   \@tempcntb#2\relax
229   \reserved@b
230 }
231 \def\reserved@b{%
232   \ifnum\@tempcnta>\@tempcntb\else
233     \reserved@c\@tempcnta
234     \advance\@tempcnta\@ne
235     \expandafter\reserved@b
236   \fi
237 }

```

Depending on the T<sub>E</sub>X version, we might not be allowed to do this for non-ASCII characters.

```

238 \def\reserved@c#1{%
239   \count@=#1\advance\count@ by -"20
240   \uccode#1=\count@
241   \lccode#1=#1
242 }

```

```

243 \reserved@a{'\a}{'\z}
244 \reserved@a{"A0}{\BC}
245 \reserved@a{"E0}{\FF}

```

The upper case characters need their `\uccode` and `\lccode` values set, and their `\sfcode` set to 999.

```

246 \def\reserved@c#1{%
247   \count@=#1\advance\count@ by "20
248   \uccode#1=#1
249   \lccode#1=\count@
250   \sfcode#1=999
251 }
252 \reserved@a{'\A}{'\Z}
253 \reserved@a{"80}{\9C}
254 \reserved@a{"C0}{\DF}

```

Well, it would be nice if that were correct, but unfortunately, the Cork encoding contains some odd slots whose `uccode` or `lccode` isn't quite what you'd expect.

```

255 \uccode'\^^Y='I      % dotless i
256 \lccode'\^^Y='^^Y    % dotless i
257 \uccode'\^^Z='J      % dotless j, ae in OT1
258 \lccode'\^^Z='^^Z    % dotless j, ae in OT1
259 \lccode'\^^9d='i     % dotted I
260 \uccode'\^^9d='^^9d  % dotted I
261 \lccode'\^^9e='^^9e  % d-bar
262 \uccode'\^^9e='^^d0 % d-bar

```

Finally here is one that helps hyphenation in the OT1 encoding.

```

263 \lccode'\^^[='^^[    % oe in OT1

```

And we also set the `\lccode` of `\-` and `\textcompwordmark` so that they do not prevent hyphenation in the remainder of the word (as suggested by Lars Helström).

```

264 \lccode'\- ='\'      % default hyphen char
265 \lccode 127=127      % alternate hyphen char
266 \lccode 23 =23       % textcompwordmark in T1

```

End of the conditional to select either Unicode or T1 encoding defaults.

```

267 \fi
    At this stage, we can install any last-minute expl3 set-up.
268 \@expl@finalise@setup@@
269 \def\@expl@finalise@setup@@{}

273   \XeTeXdashbreakstate=1 %
274 \fi

```

## 1.4 Hyphenation

The following code will be compiled into the format file. It checks for the existence of `hyphen.cfg` in inputs that file if found. Otherwise it inputs `hyphen.ltx`. Note that these are loaded in *before* the `\catcodes` are set, so local hyphenation files can use 8-bit input.

We try to load the customized hyphenation description file.

```

275 \InputIfFileExists{hyphen.cfg}
276     {\typeout{=====^J%
277             Local configuration file hyphen.cfg used^J%
278             =====}%
279     \def\@addtofilelist##1{\xdef\@filelist{\@filelist,##1}}%
280     }
281     {\input{hyphen.ltx}}
282 \let\@addtofilelist\@gobble

```

## 1.6 Input encoding

Starting with the 2018 L<sup>A</sup>T<sub>E</sub>X release default the inputencoding to UTF-8. Unless the format is being used with luatex, xetex, enc<sub>te</sub>x or ml<sub>te</sub>x.

This is done in a way largely compatible with older releases: `utf8.def` is input just as if

```
\usepackage[utf8]{inputenc}
```

had been used, however rather than input the whole package a minimal core part just enough to support loading the UTF-8 encoding files is defined here.

If a document re-specifies UTF-8 this is silently ignored.

```

346 </2ekernel>
347 <*2ekernel | latexrelease>

```

Check that a classic 8-bit tex engine is being used (LaTeX or PDFLaTeX).

```
348 \latexrelease\IncludeInRelease{2018/04/01}%
349 \latexrelease\UTFviii@invalid\UTF-8 default}%
```

Skip this section in Unicode TeX, or if MLTeX and EncTeX are enabled.

```

Set the ‘letter’ catcodes.

```

525 \def\reserved@c#1{\catcode#1=11\relax}
526 \reserved@a{'\A}{'\Z}
527 \reserved@a{'\a}{'\z}
```

All the characters in the range 0–31 and 127–255 are illegal, *except* `tab` (`^^I`), `nl` (`^^J`), `ff` (`^^L`) and `cr` (`^^M`).

## 1.7 Lccodes and uccodes

We now again set up the default (T1) uc/lccodes. The lower case characters need their `\uccode` and `\lccode` values set. Some of this is a repeat of the set-up before loading hyphenation files. Depending on the T<sub>E</sub>X version, we might not be allowed to do this for non-ASCII characters. For the Unicode engines (XeT<sub>E</sub>X and LuaT<sub>E</sub>X) there is no need to do any of this: they use hyphenation data which does not alter any of the set up and so this entire block is skipped.

```

528 \ifnum 0%
529   \ifx\Umathcode\@undefined\else 1\fi
530   \ifx\XeTeXmathcode\@undefined\else 1\fi
531   >\z@
532 \else
533 \def\reserved@c#1{%
534   \count@=#1\advance\count@ by -"20
535   \uccode#1=\count@
536   \lccode#1=#1
537 }
538 \reserved@a{'\a}{'\z}
539 \reserved@a{"A0}{\BC}
540 \reserved@a{"E0}{\FF}

```

The upper case characters need their `\uccode` and `\lccode` values set, and their `\sfcode` set to 999.

```

541 \def\reserved@c#1{%
542   \count@=#1\advance\count@ by "20
543   \uccode#1=#1
544   \lccode#1=\count@
545   \sfcode#1=999
546 }
547 \reserved@a{'\A}{'\Z}
548 \reserved@a{"80}{\9C}
549 \reserved@a{"C0}{\DF}

```

Well, it would be nice if that were correct, but unfortunately, the Cork encoding contains some odd slots whose uccode or lccode isn't quite what you'd expect.

```

550 \uccode'\^^Y=' \I      % dotless i
551 \lccode'\^^Y=' \^^Y    % dotless i
552 \uccode'\^^Z=' \J      % dotless j, ae in OT1
553 \lccode'\^^Z=' \^^Z    % dotless j, ae in OT1
554 \lccode'\^^9d=' \i     % dotted I
555 \uccode'\^^9d=' \^^9d  % dotted I
556 \lccode'\^^9e=' \^^9e  % d-bar
557 \uccode'\^^9e=' \^^d0  % d-bar

```

Finally here is one that helps hyphenation in the OT1 encoding.

```

558 \lccode'\^^[=' \^^[    % oe in OT1
559 \fi % End of reset block for 8-bit engines

```

`\BCPdata` A stub for use by babel, polyglossia, etc.

```

565     { region }    { US }
566     { script }   { Latn }
567     { tag }      { en-US }
568   }
569 }
570 \ExplSyntaxOff

```

(End of definition for \BCPdata.)

## 1.8 Case changing

`\MakeUppercase` And whilst we're doing things with uc/lc tables, here are two commands to upper- and lower-case a string.

`\MakeLowercase` Wrappers around the L3 case changing functions. `\protected` to make them mostly safe as replacements for `\uppercase` and `\lowercase`.

`\MakeTitlecase` In

`\NoCaseChange`

`\AddToNoCaseChangeList`

`\CaseSwitch`

`\DeclareCaseChangeEquivalent`

`\DeclareLowercaseMapping`

`\DeclareTitlecaseMapping`

`\DeclareUppercaseMapping`

`\DeclareLowercaseExclusions`

`\DeclareTitlecaseExclusions`

`\DeclareUppercaseExclusions`

`\@uclclist`

```

\markboth{\MakeUppercase\contentsname}
{\MakeUppercase\contentsname}

```

then the uppercasing is only done to the first letter of the contents name, since the mark expands out to:

```

\mark{\MakeUppercase Table of Contents}
{\MakeUppercase Table of Contents}

```

In order to get round this, we redefine `\MakeUppercase` and `\MakeLowercase` to grab their argument and brace it.

Earlier versions needed to process `\@uclclist` in an `\edef` to handle legacy input encodings, but recent (2022) expl3 versions handle non-UTF8 text natively so we simply call the `\text_...case:n` functions.

```

571 \ExplSyntaxOn
572 \keys_define:nn { __kernel }
573 {
574   lang .str_set:N = \reserved@a ,
575   locale .str_set:N = \reserved@a ,
576   words .choices:nn =
577     { all , first }
578     { \str_set:Nn \reserved@b {#1} }
579 }
580 \cs_new_protected:Npn \@text@case@aux #1#2#3
581 {

(End of definition for \MakeUppercase and others.)

## 1.9 Automatic insertion of \par tokens

Since 2022 the major T<sub>E</sub>X engines have a parameter, `\partokencontext`, that controls whether a `\par` token is added if T<sub>E</sub>X is in horizontal mode at the end of `\vbox` and similar contexts. This gives more control than the classical behaviour where the internal *end paragraph* routine is invoked with no explicit token being added.

Setting `\partokencontext` to 2 ensures a literal `\par` is used in all contexts, setting to 0 reverts to the classic T<sub>E</sub>X behavior.

```

672 </2ekernel>
673 <*2ekernel|latexrelease>
674 <latexrelease>\IncludeInRelease{2025/11/01}%

```

```

675 <latexrelease>                {\partokencontext}{automatic par insertion}%
676 \ifdefined\partokencontext\partokencontext=\tw@fi
677 </2ekernel|latexrelease>
678 <latexrelease>\EndIncludeInRelease
679 <latexrelease>\IncludeInRelease{0000/00/00}%
680 <latexrelease>                {\partokencontext}{automatic par insertion}%
681 <latexrelease>\ifdefined\partokencontext\partokencontext=\z@fi
682 <latexrelease>\EndIncludeInRelease
683 <*2ekernel>

```

## 1.10 Applying Patch files

Between major releases, small patches will be distributed in files `ltpatch.ltx` which must be added at this point.

Patch file code removed.

```

684 %\IfFileExists{ltpatch.ltx}
685 % {\typeout{=====^^J%
686 %           Applying patch file ltpatch.ltx^^J%
687 %           =====}}
688 % \def\fmtversion@topatch{unknown}
689 % \input{ltpatch.ltx}
690 % \ifx\fmtversion\fmtversion@topatch
691 % \ifx\patch@level\@undefined
692 % \typeout{^^J^^J^^J%
693 %          !!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!^^J%
694 %          !! Patch file 'ltpatch.ltx' not suitable for this^^J%
695 %          !! version of LaTeX.^^J^^J%
696 %          !! Please check if initex found an old patch file:^^J%
697 %          !! --- if so, rename it or delete it, and redo the^^J%
698 %          !! initex run.^^J%
699 %          !!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!^^J}%
700 % \batchmode \@@end
701 % \else

```

The code below adds the ‘patch level’ string to the first `\typeout` in the startup banner.

```

702 % \def\fmtversion@topatch{0}%
703 % \ifx\fmtversion@topatch\patch@level\else
704 % \def\reserved@a\typeout##1##2\reserved@a{%
705 % \typeout{##1 patch level \patch@level}##2}
706 % \everyjob\expandafter\expandafter\expandafter{%
707 % \expandafter\reserved@a\the\everyjob\reserved@a}
708 % \let\reserved@a\relax
709 % \the\everyjob
710 % \fi
711 % \fi
712 % \else
713 % \typeout{^^J^^J^^J%
714 %          !!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!^^J%
715 %          !! Patch file 'ltpatch.ltx' (for version <\fmtversion@topatch>)^^J%
716 %          !! is not suitable for version <\fmtversion> of LaTeX.^^J^^J%
717 %          !! Please check if initex found an old patch file:^^J%
718 %          !! --- if so, rename it or delete it, and redo the^^J%
719 %          !! initex run.^^J%
720 %          !!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!^^J}%

```

```

721 %      \batchmode \@@end
722 %      \fi
723 %      \let\fmtversion@topatch\relax
724 %    }{}

```

## 1.11 Freeing Memory

`\reserved@a` And just to make sure nobody relies on those definitions of `\reserved@b` and friends.  
`\reserved@b` These macros are reserved for use in the kernel. *Do not use them as general scratch macros.*

```

725 \let\reserved@a\@filelist
726 \let\reserved@b=\@undefined
727 \let\reserved@c=\@undefined
728 \let\reserved@d=\@undefined
729 \let\reserved@e=\@undefined
730 \let\reserved@f=\@undefined

```

(End of definition for `\reserved@a` and `\reserved@b`.)

`\toks`

```

731 \toks0{}
732 \toks2{}
733 \toks4{}
734 \toks6{}
735 \toks8{}

```

(End of definition for `\toks`.)

`\errhelp` Empty the error help message, which may have some rubbish:

```

736 \errhelp{}

```

(End of definition for `\errhelp`.)

## 1.12 Initialise file list

`\@providesfile` Initialise for use in the document. During initex a modified version has been used which leaves debugging information for `latexbug.tex`.

```

737 \def\@providesfile#1[#2]{%
738   \wlog{File: #1 #2}%
739   \expandafter\xdef\csname ver@#1\endcsname{#2}%
740   \endgroup}

```

(End of definition for `\@providesfile`.)

`\@filelist` Reset `\@filelist` so files input while making the format are not listed. The list built up so far may take up a lot of memory and so it is moved to `\reserved@a` where it will be overwritten as soon as almost any `LATEX` command is issued in a class file. However the `latexbug.tex` program will be able to access this information and insert it into a bug report.

`\@addtofilelist`

```

741 \let\@filelist\@gobble
742 \def\@addtofilelist#1{\xdef\@filelist{\@filelist,#1}}%

```

(End of definition for `\@filelist` and `\@addtofilelist`.)

### 1.13 Preparation for supporting PDF in backends

At the current point in time, basic support for PDF in backends is not part of L<sup>A</sup>T<sub>E</sub>X core; it is provided by external packages. At some time in the future that work will be placed into the kernel but for now it is separate and has to be explicitly loaded in the document.

In that code there is a command `\IfPDFManagementActiveTF` which can be used by packages in order to execute different code depending on the whether this basic backend support is loaded.

To make this also work properly when this external package is not loaded at all, we here add this command already in the kernel (with a trivial definition); thus any package can query this loading state in all circumstances. Once this basic PDF backend support gets moved to the kernel, this definition will vanish again from here or, rather, it will be replaced by a real test.

`\IfPDFManagementActiveTF` So long as the code for the basic backend support for PDF is not loaded, the test that is implicit here will always return the false branch. Once this code is loaded, this definition will get replaced by a real test (as it is then possible that the management code is either activated or not activated).

```
743 \let \IfPDFManagementActiveTF \@secondoftwo
```

The T/F variants are defined in a way that they continue to work when the main definition changes.

```
744 \long\def\IfPDFManagementActiveT#1{\IfPDFManagementActiveTF{#1}{}}
```

```
745 \def\IfPDFManagementActiveF{\IfPDFManagementActiveTF{}}
```

*(End of definition for \IfPDFManagementActiveTF.)*

### 1.14 Do some temporary work for pre-release

This is a good place to load code that hasn't yet been integrated into the other files ...

### 1.15 Some last minute initializations ...

Load the first aid set of definitions for external packages that await updates.

```
746 \@input{latex2e-first-aid-for-external-files.ltx}
```

### 1.16 Dumping the format

Finally we make @ into a letter, ensure the format will be in the 'normal' error mode, and dump everything into the format file.

```
747 \makeatother
```

```
748 \errorstopmode
```

```
749 \dump
```

```
750 </2ekernel>
```

# Change History

1985-11-04 ltmath.dtx LaTeX2.09		<code>\mathversion</code> : Test if version defined added. . . . .	551
General: produce warning message if line extends into margin. Doesn't warn about formula overprinting equation number. . . . .	864		
1989-04-10 ltfssbas.dtx v1.0a		1989-04-29 ltfssbas.dtx v1.0i	
General: Starting with version numbers! <code>\ifmmode</code> added in <code>\math@group</code> . . . . .	538	General: Removed the <code>\halign</code> <code>\noalign</code> correction (wasn't bugfree) . . . . .	538
1989-04-10 ltfssbas.dtx v1.0b		1989-04-29 ltfssini.dtx v1.0f	
General: <code>\preload@sizes</code> added. . . . .	538	General: Corrections to L <sup>A</sup> T <sub>E</sub> X tabular env. added. . . . .	702
<code>\wrong@fontshape</code> changed to define substitution font/shape macro. . . . .	538	1989-05-01 ltfssbas.dtx v1.0j	
1989-04-10 ltfssini.dtx v1.0a		General: Default for <code>\baselinestretch</code> added. . . . .	538
General: Starting with version numbers <code>\newif</code> for <code>\@tempswa</code> added since this switch is unknown at the time when this file is read in. (latex.tex is loaded later.) <code>\math@famname</code> changed to <code>\math@version</code> . . . . .	702	1989-05-22 ltfssbas.dtx v1.0k	
1989-04-14 ltfssbas.dtx v1.0c		General: Lines longer than 72 characters folded. . . . .	538
General: More documentation added. . . . .	538	1989-05-22 ltfssini.dtx v1.0g	
1989-04-15 ltfssini.dtx v1.0b		General: Lines shortened to 72 characters . . . . .	702
General: <code>\mathfontset</code> renamed to <code>\mathversion</code> . . . . .	702	1989-09-14 ltfssbas.dtx v1.0m	
1989-04-19 ltfssbas.dtx v1.0d		General: Global replacement: <code>\group</code> to <code>\mathgroup</code> . . . . .	538
General: Even more doc. . . . .	538	<code>\mathversion</code> : Corrected typo: <code>\endscname</code> to <code>\endcsname</code> . . . . .	551
1989-04-21 ltfssbas.dtx v1.0e		1989-11-07 ltfssini.dtx v1.0i	
General: Documentation is fun! Parameters of <code>\define@mathalphabet</code> changed. . . . .	538	General: All family, series, and shape names abbreviated. . . . .	702
1989-04-21 ltfssini.dtx v1.0c		1989-11-08 ltfssbas.dtx v1.0o	
General: Changed to conform to fam.tex. . . . .	702	General: First parameter of <code>\define@mathalphabet</code> and <code>\define@mathgroup</code> changed from string to control sequence. . . . .	538
1989-04-23 ltfssbas.dtx v1.0f		1989-11-14 ltfssbas.dtx v1.0p	
General: % in <code>\getanddefinefonts</code> added. . . . .	538	<code>\math@version</code> : Math version prefix 'mv@' added. . . . .	551
1989-04-26 ltfssini.dtx v1.0d		1989-11-19 ltfssbas.dtx v1.0q	
General: <code>\xpt</code> added. . . . .	702	<code>\define@newfont</code> : Group added. . . . .	554
1989-04-27 ltfssbas.dtx v1.0g		<code>\wrong@fontshape</code> : Instead of calling <code>\family\default@family</code> , etc. we directly set <code>\f@family</code> , etc. . . . .	559
General: Documentation revised. . . . .	538	1989-11-22 ltfssbas.dtx v1.0r	
1989-04-27 ltfssini.dtx v1.0e		<code>\math@version</code> : <code>\def</code> → <code>\edef</code> for <code>\math@version</code> . . . . .	551
General: Definitions of L <sup>A</sup> T <sub>E</sub> X symbols corrected. . . . .	702	1989-11-25 ltfssbas.dtx v1.0s	
1989-04-29 ltfssbas.dtx v1.0h		General: All <code>\edef\font@name</code> changed to <code>\xdef\font@name</code> . Necessary after introduction of <code>\begingroup/\endgroup</code> in v1.0q. . . . .	538
General: Documented problem with <code>\halign</code> , and <code>\noalign</code> . . . . .	538	extra// → + in <code>\extra@def</code> . . . . .	538

General: <code>\input</code> of files now handled by docstrip. . . . . 702	General: (RmS) inserted extra braces around entry for NFSS . . . . . 938
1990-04-05 ltfsstrc.dtx v1.0m	1991-08-14 ltthm.dtx LaTeX2.09
<code>\selectfont</code> : Call <code>\tracingon</code> only if <code>\tracingfonts</code> greater than 3. . . 642	<code>\endtheorem</code> : Moved <code>\itshape</code> after <code>\item</code> to make it work with NFSS 968
1990-05-05 ltfsstrc.dtx v1.0n	1991-08-26 ltfsini.dtx v1.1n
<code>\selectfont</code> : <code>\tracingon</code> with new syntax. . . . . 642	<code>\reset@font</code> : Macro introduced . . . 727
1990-06-23 ltfsini.dtx v1.1k	1991-08-26 ltmiscen.dtx LaTeX2.09
<code>\nfss@text</code> : Changed to <code>\mbox</code> . . . 727	<code>\verbatim</code> : <code>\@@par</code> added . . . . . 846
1990-06-24 ltfsbas.dtx v1.2j	1991-08-26 ltpictur.dtx LaTeX2.09
<code>\DeclarePreloadSizes</code> : Missing percent added. . . . . 546	<code>\endpicture</code> : (RmS & FMI) extra boxing level around <code>\@picbox</code> to guard against unboxing in math mode (proposed by John Hobby) 936
1990-06-24 ltfsstrc.dtx v1.0o	1991-08-26 ltplain.dtx LaTeX2.09
<code>\baselinestretch</code> : Moved to tracefnt.dtx. . . . . 647	<code>\tracingall</code> : Added
<code>\getanddefine@fonts</code> : <code>\Adding</code> tracing code. . . . . 651	<code>\errorcontextlines=\maxdimen</code> , suggested by J. Schrod . . . . . 31
<code>\Macro</code> moved from fam.dtx. . . . 650	1991-09-29 ltboxes.dtx LaTeX2.09
Adding debug code. . . . . 651	<code>\mpfootnotetext</code> : (RmS) added
<code>\use@mathgroup</code> : Tracing code added. 650	<code>\reset@font</code> . . . . . 903
1990-06-30 ltfsbas.dtx v1.2l	1991-09-29 ltfloat.dtx LaTeX2.09
<code>\showhyphens</code> : Macro added. . . . . 565	<code>\@footnotetext</code> : (RmS) added
1990-06-30 ltfsstrc.dtx v1.0p	<code>\reset@font</code> . . . . . 1002
<code>\use@mathgroup</code> : Added <code>\relax</code> after math group number. . . . . 650	1991-09-29 ltmath.dtx LaTeX2.09
1990-07-07 ltfsstrc.dtx v1.0q	<code>\eqnnum</code> : RmS: <code>\reset@font</code> added. 864
<code>\getanddefine@fonts</code> : Group number added to tracing. . . . . 651	1991-09-29 ltsect.dtx LaTeX2.09
<code>\math@egroup</code> : Tracing code added. 650	<code>\dottedtocline</code> : (RmS) added
<code>\use@mathgroup</code> : Group number added to tracing. . . . . 650	<code>\reset@font</code> for page number . . 981
1990-08-27 ltfsstrc.dtx 1.0r	1991-10-17 ltctrl.dtx LaTeX2.09
<code>\type@restoreinfo</code> : Some extra tracing info. . . . . 646	<code>\tfor</code> : (RmS) <code>\xdef</code> replaced by <code>\def</code> (See FMI's array.doc) . . . . . 399
1990-08-27 ltfsstrc.dtx v1.0r	1991-10-25 ltbibl.dtx LaTeX2.09
<code>\getanddefine@fonts</code> : Correcting missing name after <code>\tracingon</code> . . 651	<code>\citex</code> : added <code>\reset@font</code> , suggested by Bernd Raichle. . . 1011
1991-03-28 ltfsini.dtx v1.1m	1991-11-01 ltfloat.dtx LaTeX2.09
<code>\copyright</code> : Extra braces added. . . 727	<code>\footnote</code> : (RmS) Added
1991-03-30 ltfsini.dtx v1.2g	<code>\let\protect\noexpand</code> in <code>\footnote</code> , <code>\footnotemark</code> , and <code>\footnotetext</code> , since <code>\xdef</code> is used . . . . . 1002
<code>\newfont</code> : Definition added. . . . . 725	1991-11-04 ltlists.dtx LaTeX2.09
<code>\symbol</code> : Definition added. . . . . 726	<code>\makelabel</code> : (RmS) added default definition for <code>\makelabel</code> , to produce an error message. . . . . 885
1991-07-24 ltmiscen.dtx LaTeX2.09	1991-11-04 ltplain.dtx RmS
<code>\@verbatim</code> : Added	General: Removed <code>\itemitem</code> since never needed/useful with L <sup>A</sup> T <sub>E</sub> X. . 29
<code>\penalty\interlinepenalty</code> to definition of <code>\par</code> so that	1991-11-06 ltbibl.dtx LaTeX2.09
<code>\samepage</code> works . . . . . 846	<code>\citex</code> : added code to remove a leading blank . . . . . 1011
1991-08-14 ltmath.dtx LaTeX2.09	
<code>\cases</code> : (RmS) inserted extra braces around entry for NFSS . . . . . 857	

1991-11-13 ltbibl.dtx LaTeX2.09	avoid conflicts with other channels allocated by <code>\newread</code> . . . . .	80
<code>\@bibitem</code> : Changed counter <code>enumi</code> to <code>enumiv</code> , as it says in the comment above . . . . .	1992-03-18 ltfloat.dtx LaTeX2.09	
1991-11-21 ltfssini.dtx v1.1o	<code>\@xympar</code> : (RmS) added	997
<code>\reset@font</code> : Added extra braces for robustness. . . . .	<code>\global\@ignorefalse</code> . . . . .	997
Changed to protected version of macro. . . . .	<code>\end@float</code> : (RmS) changed	991
1991-11-22 ltfloat.dtx LaTeX2.09	<code>\@esphack</code> to <code>\@Esphack</code> . . . . .	991
<code>\footnote</code> : (RmS) Added	1992-03-18 ltlists.dtx 0.0	
<code>\let\protect\noexpand</code> in	<code>\trivlist</code> : RmS: added	
<code>\@xfootnote</code> , <code>\@xfootnotemark</code> , and <code>\@xfootnotetext</code> . . . . .	<code>\@nmbrlistfalse</code> . . . . .	880
1991-11-22 ltlists.dtx LaTeX2.09	1992-03-18 ltmiscen.dtx LaTeX2.09	
<code>\@item</code> : (RmS) Changed second call to <code>\makelabel</code> to	<code>\begin</code> : Changed <code>\@ignoretrue</code> to <code>\@ignorefalse</code> (as documented) . . . . .	837
<code>\unhbox\@tempboxa</code> . Avoids problems with side effects in <code>\makelabel</code> and is more efficient. . . . .	1992-03-21 ltfssini.dtx v1.2d	
1991-11-27 ltfssbas.dtx v1.3a	General: Renamed <code>\text</code> to <code>\nfss@text</code> to make it internal. . . . .	702
General: All <code>\family</code> , <code>\shape</code> etc. renamed to <code>\fontfamily</code> etc. . . . .	1992-05-12 ltfssbas.dtx v1.3c	
1991-11-27 ltfssini.dtx v1.2a	<code>\extract@alph@from@version</code> : Macro added. . . . .	563
General: All <code>\family</code> , <code>\shape</code> etc. renamed to <code>\fontfamily</code> etc. . . . .	<code>\select@group</code> : Added call to <code>\extract@alph@from@version</code> . . . . .	562
1992-01-06 ltfssini.dtx v1.2c	1992-07-26 ltfssbas.dtx v1.9a	
General: added <code>slitex</code> code . . . . .	<code>\curr@fontshape</code> : . . . . .	554
1992-01-10 ltbibl.dtx LaTeX2.09	<code>\DeclareFontShape</code> : Introduced	
<code>\@bibitem</code> : Changed <code>\c@enumiv</code> to <code>\value of \@listctr</code> . . . . .	<code>\DeclareFontShape</code> . . . . .	539
1992-01-10 ltmath.dtx LaTeX2.09	<code>\define@newfont</code> : . . . . .	554
<code>equation</code> : RmS: put <code>\hbox</code> around <code>\@eqnnum</code> to typeset the equation number in text mode (as in the <code>eqnarray</code> env.) . . . . .	<code>\math@fonts</code> : . . . . .	561
1992-01-10 ltthm.dtx LaTeX2.09	<code>\select@group</code> : . . . . .	562
<code>\@othm</code> : (RmS) Check for existence of theorem environment . . . . .	<code>\split@name</code> : Added splitting into <code>\f@encoding</code> . . . . .	554
1992-01-14 ltbibl.dtx LaTeX2.09	<code>\wrong@fontshape</code> : . . . . .	559
<code>\@biblabel</code> : removed <code>\hfill</code> . . . . .	1992-07-26 ltfssstrc.dtx v2.0b	
1992-01-14 ltsect.dtx 0.0	<code>\s@fct@</code> : . . . . .	660
<code>\@starttoc</code> : (RmS) added <code>\immediate</code> to <code>\openout</code> as all <code>\write</code> commands are also executed	<code>\s@fct@sub</code> : documentation fixes . . . . .	661
<code>\immediate</code> . . . . .	<code>\selectfont</code> : . . . . .	643
1992-02-26 ltbibl.dtx LaTeX2.09	<code>\try@simple@size</code> : . . . . .	654
<code>\@lbibitem</code> : Added <code>\hfill</code> to restore left-alignment of bibliography labels in alpha style . . . . .	<code>\try@size@range</code> : . . . . .	657
1992-03-18 ltdefns.dtx LaTeX2.09	<code>\use@mathgroup</code> : . . . . .	650
General: (RmS) changed input channel from 0 to <code>\@inputcheck</code> to	1992-08-14 ltbibl.dtx LaTeX2.09	
	<code>\@citex</code> : added missing argument braces around <code>\hbox</code> , found by Ed Sznyter . . . . .	1011
	1992-08-14 ltboxes.dtx LaTeX2.09	
	<code>\endminipage</code> : (RmS) replaced <code>\vskip</code> - <code>\lastskip</code> by <code>\unskip</code> (proposed by FMi) . . . . .	903
	1992-08-17 ltbibl.dtx LaTeX2.09	
	<code>\@citex</code> : simplified code for removing leading blanks in citation key (proposed by Frank Jensen and Kresten Krab Thorup) . . . . .	1011
	1992-08-19 ltsect.dtx 0.0	
	<code>\@xsect</code> : (RmS) corrected bug: stretch and shrink in argument to <code>\hskip</code>	

previously not negated . . . . .	974	<code>\footnote:</code> (RmS) Changed all to 'def'protect'noexpand'protect'noexpand . . . . .	1002
1992-08-19 ltthm.dtx LaTeX2.09		1992-12-03 ltffssini.dtx v?	
<code>\@othm:</code> (RmS) Changed error message to complain about undefined counter . . . . .	967	<code>\hexnumber@:</code> Make it accept counters. . . . .	726
1992-08-20 ltffssini.dtx v1.4b		1993-03-08 preload.dtx v2.0b	
<code>\@setsize:</code> Added <code>\@currsize.</code> . . .	726	General: Added 12pt preloads . . . .	753
1992-08-24 ltdefns.dtx LaTeX2.09		1993-03-18 ltffsbas.dtx v2.0c	
<code>\@ifnextchar:</code> (Rms) <code>\@ifnextchar</code> didn't work if its first argument was an equal sign. . . . .	108	General: Changed all <code>\@tempdima</code> in <code>\@tempdimb</code> to avoid killing <code>\numberline</code> . . . . .	538
1992-08-24 ltmiscen.dtx LaTeX2.09		1993-03-18 ltfsstrc.dtx v2.1b	
<code>\begin:</code> Added code to <code>\begin</code> to remember line number. Used by <code>\@badend</code> to display position of non-matching <code>\begin.</code> . . . . .	837	General: Changed all <code>\@tempdima</code> in <code>\@tempdimb</code> to avoid killing <code>\numberline</code> . . . . .	638
<code>\verb:</code> Changed <code>\verb</code> and <code>\@sverb</code> to work correctly in math mode . . .	851	Changed all <code>\@tempdimb</code> in <code>\@tempdimx</code> to avoid killing <code>\numberline</code> . . . . .	638
1992-08-25 ltsect.dtx LaTeX2.09		1993-03-18 ltfsstrc.dtx v2.1c	
<code>\@sect:</code> (Fmi) replaced explicit setting of <code>\@svsec</code> by call to <code>\@seccntformat</code> . . . . .	973	<code>\DeclareSizeFunction:</code> Added all args to avoid blanks problems . .	657
1992-09-18 ltlists.dtx LaTeX2.09		1993-04-09 lterror.dtx v1.0e	
<code>\item:</code> (RmS) Added warning if <code>\item</code> is used in math mode . . . . .	883	<code>\@latexerr:</code> Mention The Companion . . . . .	406
1992-09-18 lttab.dtx LaTeX2.09		1993-04-11 lterror.dtx v1.0f	
<code>\@array:</code> Changed <code>\par</code> to <code>\@empty</code> to avoid starting new row e.g. after <code>\hline</code> . . . . .	921	<code>\@latexerr:</code> Remove setting of errorcontextlines . . . . .	406
1992-09-19 ltfsstrc.dtx v2.0c		1993-05-05 ltftncmd.dtx v2.0b	
<code>\try@simple@size:</code> . . . . .	654	General: Removed all LaTeX related cmds . . . . .	756
1992-09-21 ltffssini.dtx v1.4d		1993-05-16 ltffsbas.dtx v2.0e	
<code>\not@math@alphabet:</code> Macro defined. .	725	<code>\showhyphens:</code> Use <code>\reset@font</code> . .	565
1992-09-22 ltffsbas.dtx v1.91a		1993-07-16 ltfsstrc.dtx v2.1h	
General: Introduced <code>\tf@size</code> for math size. . . . .	538	General: Changed layout of info messages . . . . .	638
1992-09-22 ltfsstrc.dtx v2.1a		1993-07-17 ltoutenc.dtx 1.0d	
<code>\getanddefine@fonts:</code> Introduced <code>\tf@size</code> for math size. . . . .	651	General: changed <code>\catcoding @</code> . . .	481
1992-11-13 ltffssini.dtx v?		1993-08-03 ltmiscen.dtx LaTeX2.09	
<code>\hexnumber@:</code> Made expandable. . . .	726	<code>\enddocument:</code> Changed redefinition of <code>\global</code> to redefinition of <code>\@setckpt.</code> . . . . .	829
1992-11-23 ltcounts.dtx LaTeX2.09		1993-08-05 ltpictur.dtx LaTeX2.09	
<code>\stepcounter:</code> Replaced <code>{}</code> in <code>\stepcounter</code> by <code>\begingroup</code> <code>\endgroup</code> to avoid adding an empty ord in math mode . . . . .	527	<code>\circle:</code> (RMS) Added error message if <code>\circle</code> is used in math mode. .	958
1992-11-26 ltboxes.dtx LaTeX2.09		1993-08-05 ltsect.dtx LaTeX2.09	
<code>\@mpfootnotetext:</code> (RmS) added protection for <code>\edef</code> . . . . .	903	<code>\@sect:</code> (RmS) Made sure that <code>\protect</code> works correctly in expansion of <code>\the</code> counter . . . .	973
1992-11-26 ltfloat.dtx LaTeX2.09		1993-08-05 ltspac.dtx LaTeX2e	
<code>\@footnotetext:</code> (RmS) added protection for <code>\edef</code> . . . . .	1002	<code>\@hspace:</code> (RmS) Removed superfluous <code>\leavevmode</code> in <code>\@hspace</code> and <code>\@hspace</code> , as suggested by CAR. . . . .	451

1993-08-05 lttab.dtx latex2e		
\tabular*: Replaced		
\expandafter\def by \@namedef.	920	
1993-08-06 ltbibl.dtx LaTeX2.09		
\@citex: Moved writing to .aux file in		
loop over citation keys so that		
leading blanks are removed there		
as well.	1011	
1993-08-13 ltoutenc.dtx 1.0f		
General: Protected against active @		
sign.	481	
1993-08-13 preload.dtx v2.0c		
General: Added \relax at end of font		
names.	754	
1993-08-16 ltoutenc.dtx 1.0g		
General: Needs space after \string	481	
1993-08-18 ltfsdcl.dtx v2.0e		
\new@mathversion: Exchanged names		
of encodings in warning message of		
\SetSymbolFont.	683	
1993-09-02 ltfsstrc.dtx v2.1i		
General: Corrected name of sgen size		
function.	638	
1993-09-03 ltmiscen.dtx LaTeX2.09		
\verbatim@nolig@list: Replaced		
\@noligs by extensible list	851	
1993-09-07 ltmiscen.dtx LaTeX2.09		
\verb@balance@group: (RmS)		
Changed definition of \verb so		
that it detects a missing second		
delimiter.	851	
1993-09-08 ltmiscen.dtx LaTeX2.09		
\enddocument: Added warning in case		
of undefined references.	829	
1993-09-15 ltfsbas.dtx v2.0g		
\DeclareFontEncoding: Corrected:		
\default@T to \default@M.	542	
1993-09-15 ltfsstrc.dtx v2.1j		
General: Corrected spelling of		
\noxpand.	638	
1993-09-19 lterror.dtx LaTeX2.09		
\@invalidchar: (RmS) Error message		
for invalid input characters.	410	
1993-11-02 ltmath.dtx LaTeX2.09		
General: RmS: Corrected description		
of \@eqnset, moved \@eqnset		
accordingly and removed extra		
\tabskip assignment.	864	
1993-11-03 ltmath.dtx LaTeX2e		
General: RmS: Initialized \everycr to		
empty	864	
1993-11-03 ltpictur.dtx LaTeX2.09		
General: (RmS) changed \halign to		
\ialign to initialize \tabskip and		
\everycr	938	
1993-11-11 ltfsini.dtx v2.1a		
\normalfont: Macro added	727	
1993-11-11 ltfsstrc.dtx v2.2a		
General: Option concept added for		
LaTeX2e	638	
1993-11-14 ltclass.dtx v0.2a		
\@current: Name changed from		
\@currentextension	1056	
\@reset@ptions: macro added	1083	
\AtEndDocument: Included extension		
in the generated macro name for		
package and class hooks.	1084	
\documentstyle: Added		
\RequirePackage		
\@unusedoptionlist stuff.	1072	
\load@onefilewithoptions: Moved		
resetting of \default@ds, \ds@ and		
\@declaredoptions here, from the		
end of \ProcessOptions.	1077	
\NeedsTeXFormat: made more robust		
for alternative syntax for other		
formats.	1074	
\ProcessOptions*: Optimize 'empty		
option' code.	1068	
Stop adding the global option list		
inside class files.	1068	
1993-11-14 ltdefs.dtx v0.2a		
\g@addto@macro: Made global	112	
1993-11-15 ltclass.dtx v0.2b		
\documentstyle: Modified to match		
\ProcessOption*	1072	
\ProcessOptions*: Star form		
added.	1068	
1993-11-17 ltclass.dtx v0.2c		
\@fileswith@ptions: Macro added	1083	
\@badrequireerror: Macro added	1086	
\@twoloadclasserror: Macro added	1086	
\CurrentOption: Name changed from		
\@curroption	1055	
\DeclareOption*: Error checking		
added	1067	
\load@onefilewithoptions: Added		
trap for two \LoadClass		
commands.	1080	
\NeedsTeXFormat: Name changed from		
\NeedsFormat	1074	
\ProcessOptions*: restoring		
\@fileswith@ptions added.	1068	
1993-11-18 ltclass.dtx v0.2d		
\documentstyle: Modified		
\RequirePackage stuff.	1072	

\ExecuteOptions: Use		\newcommand: Macro added . . . . .	82

changed . . . . .	758	1993-12-13 ltmiscen.dtx v0.9h	
<code>\emph</code> : Macro changed . . . . .	759	<code>\@noligs</code> : Readded <code>\@noligs</code> . . . .	852

<code>\@verbatim</code> : Readded <code>\@noligs</code> . . .	846	1993-12-17 ltoutenc.dtx 1.3	
Removed optional argument of		General: Added this section . . . . .	482
<code>\item</code> . . . . .	846	Removed all the hackery for use in	
<code>center</code> : Removed optional argument		<code>\DeclareFontEncoding</code> , and redid	
of <code>\item</code> . . . . .	843	everything using	
<code>flushleft</code> : Removed optional		<code>\DeclareTextFoo</code> . . . . .	494, 497
argument of <code>\item</code> . . . . .	844	Removed the catcode hackery, since	
<code>flushright</code> : Removed optional		the file is only read as a package in	
argument of <code>\item</code> . . . . .	845	the preamble, and removed all the	
1993-12-13 ltoutenc.dtx v1.2b		messages on the screen, which just	
General: Corrected file name in driver		confuse users. Replaced them by	
code. . . . .	478	the appropriate <code>\ProvidesPackage</code>	
1993-12-13 lttab.dtx latex2e		commands. Added XXXenc. . . .	481
<code>\tabbing</code> : Removed optional argument		1993-12-17 ltoutenc.dtx v1.3	
of <code>\item</code> . . . . .	915	General: Added	
1993-12-14 ltoutput.dtx v1.0i		<code>\EncodingSpecificAccent</code> ,	
General: Section added to declare all		<code>\EncodingSpecificAccentedLetter</code>	
parameters . . . . .	1259	and <code>\EncodingSpecificCommand</code> . . . .	478
1993-12-15 ltboxes.dtx v0.1d		Made Rokicki's encoding a proper	
<code>\@iminipage</code> : Changed default from		encoding scheme rather than a	
'c' to 's' . . . . .	902	variant of OT1. . . . .	478
<code>\@iparbox</code> : Changed default from 'c'		1993-12-17 ltoutput.dtx v1.0j	
to 's' . . . . .	899	<code>\@opcol</code> : Hook removed . . . . .	1194
<code>\minipage</code> : Changed default from 'c'		<code>\@specialoutput</code> : Page room test	
to 's' . . . . .	902	added . . . . .	1189
extra space removed. . . . .	902	<code>\@topnewpage</code> : check for vsize too	
<code>\parbox</code> : Changed default from 'c' to		small added . . . . .	1184
's' . . . . .	899	Page room test added . . . . .	1185
1993-12-15 ltclass.dtx v0.2p		<code>\@writesetup</code> : —and then removed	1208
General: Removed extra 's from		<code>\fl@tracemessage</code> : tracefloatvals	
<code>\@warnings</code> . . . . .	1054	made a document command . . .	1246
1993-12-16 ltlogos.dtx LaTeX2e		1993-12-17 ltpage.dtx LaTeX2e	
<code>\LaTeXe</code> : Extended logo by DPC . .	453	<code>\mark</code> : Removed init <code>\mark</code> at begin	
1993-12-16 ltmath.dtx v0.9i		document, since it doesn't work. . .	1048
<code>\@eqnocr</code> : use <code>\refstepcounter</code>		<code>\rightmark</code> : Stopgap solution to mark	
instead of shortcut . . . . .	866	<code>\leftmark</code> and <code>\rightmark</code> work	
General: use <code>\refstepcounter</code> instead		without initializing mark until the	
of shortcut . . . . .	864	problem is solved. . . . .	1048
1993-12-16 ltmiscen.dtx v0.9i		1993-12-18 ltoutenc.dtx 1.3b	
General: <code>\literal</code> added . . . . .	852	General: Fixed typos with	
1993-12-16 ltpage.dtx LaTeX2e		<code>\ProvidesPackage</code> lines. Added	
<code>\mark</code> : Init <code>\mark</code> at begin document	1048	the <code>\NeedsTeXFormat</code> line. Added	
1993-12-16 ltspace.dtx LaTeX2e		the last argument to	
<code>\@bsphack</code> : Corrected optimisation .	440	<code>\DeclareEncoding</code> . Moved the use	
1993-12-16 lttab.dtx latex2e		of the encodings to after their	
<code>\@xhline</code> : Measure from middle of		declaration. . . . .	481
vertical rules . . . . .	930	Replaced the missing last argument	
1993-12-17 ltclass.dtx v0.2q		to <code>\DeclareFontEncoding</code> . . . .	494, 497
<code>\@documentclasshook</code> : Macro added	1055	1993-12-18 ltoutenc.dtx 1.3c	
<code>\@fileswithoptions</code> : Add		General: Rewrote for the new syntax	
<code>\@compatibility</code> hook . . . . .	1075	of <code>\EncodingSpecific</code> . . . .	494, 497
<code>\documentstyle</code> : Match Alan's new		Split <code>\EncodingSpecificAccent</code> up	
code. . . . .	1072	into <code>\EncodingSpecific</code> and	
		<code>\DeclareAccent</code> . . . . .	482

1993-12-18 ltoutenc.dtx v1.3a	1994-01-14 ltdirchk.dtx v0.2d
General: Replaced OT3 by XXX . . . 478	\IfFileExists: Close the texsys.aux
1993-12-18 ltoutenc.dtx v1.3b	output stream . . . . . 10
General: Corrected typos. . . . . 478	1994-01-15 ltfiles.dtx v0.9o
Replaced the missing last argument	\document: move \@preamblecmds
to \DeclareFontEncoding. . . . . 478	after document hook . . . . . 458
1993-12-18 ltoutenc.dtx v1.3c	1994-01-17 ltclass.dtx v0.2s
General: A new syntax, separating	\@fileswithoptions: Modify to
accent-definitions from	reduce parameter stack usage . . 1075
encoding-specific definitions, and	General: Added many more
allowing encoding-specific	\@onlypreamble commands . . . 1054
\chardef, \let, etc. . . . . 478	Wrapped long lines to column 72 1054
Rewrote for the new syntax of	\load@onefile@withoptions: Modify
\EncodingSpecific. . . . . 478	to reduce parameter stack usage 1081
1993-12-18 ltoutenc.dtx v1.3d	1994-01-17 ltfiles.dtx LaTeX2e
General: Some T1 stuff had drifted	\listfiles: New Version, adds 'tex'
into the OT1 file. . . . . 478	if needed, and lines up columns . 476
1993-12-18 ltpage.dtx LaTeX2e	1994-01-17 ltfsbas.dtx v2.1a

1994-04-18 ltssdcl.dtx ???	Warning message removed as it will be generated later . . . . .
\DeclareMathAlphabet: Pass correct arg (2 not 3) . . . . .	General: Changed \@normalsize to \normalsize. . . . .
1994-04-18 ltssdcl.dtx v2.1d	Corrected unverbbed commands in documentation. . . . .
General: Removed surplus \no@alphabet@error (see fam.dtx) . . . . .	Removed some long lines and other aesthetic changes. . . . .

Warning messages changed/corrected. . . . .	1168	1994-04-30 ltfontcmd.dtx v3.3b General: Documentation up-dated and tidied . . . . .	756
1994-04-24 ltpictur.dtx v0.1b General: Removed surplus spaces after <code>\hbox to</code> in several cases . . . . .	933	Prefix frag@ changed to frag in <code>\@protecteddef</code> . . . . .	756
1994-04-25 ltclass.dtx v0.3h General: Removed spurious extra 's at the end of error messages . . . . .	1054	Title changed . . . . .	756
1994-04-25 ltfloat.dtx v1.0e <code>\@largefloatcheck</code> : Changed warning message to give more info . . . . .	992	Warning changed to info message in <code>\@protecteddef</code> . . . . .	756
Command added . . . . .	992	1994-04-30 ltoutput.dtx v1.0n <code>\@activechar@info</code> : <code>\@activechar@warning</code> changed to <code>\@activechar@info</code> . . . . .	1207
General: Changed warning messages . . . . .	983	<code>\@combinedblfloats</code> : Removed rule in topnewpage case . . . . .	1215
Removed obsolete tracing code . . . . .	983	<code>\@emptycol</code> : Empty column action added: <code>\@emptycol</code> . . . . .	1184
1994-04-27 ltfssstrc.dtx v2.3e General: Corrected item that was forgotten in last change. . . . .	638	<code>\@flsetnum</code> : Rogue space removed . . . . .	1251
1994-04-28 lterror.dtx v1.0j <code>\@inmatherr</code> : Macro added . . . . .	410	<code>\@specialoutput</code> : Cut-off point changed to <code>2\baselineskip</code> . . . . .	1189
1994-04-28 lterror.dtx v1.1c <code>\@inmatherr</code> : Replaced <code>\noexpand</code> with <code>\protect</code> . . . . .	410	Empty column action added: <code>\@emptycol</code> . . . . .	1189
1994-04-28 ltfssdcl.dtx v2.1e General: Removed all <code>\uppercase</code> in hex num parsing macros . . . . .	669	Extra empty column added for twocolumn case . . . . .	1189
1994-04-28 ltlists.dtx v1.0c <code>\item</code> : Replaced <code>\@ltxnomath</code> by <code>\@inmatherr</code> . . . . .	883	Extra empty column added for twocolumn case (wrong, see below) . . . . .	1189
1994-04-28 ltpictur.dtx v0.1c <code>\@multiput</code> : (DPC) Macro added . . . . .	937	<code>\@topnewpage</code> : Added setting of <code>\col@number</code> . . . . .	1184
General: bezier curves added . . . . .	960	Cut-off point changed to <code>3\baselineskip</code> . . . . .	1185
<code>\multiput</code> : (DPC) Ignore spaces between )( . . . . .	936	Empty column action added: <code>\@emptycol</code> . . . . .	1185
<code>\picture</code> : (DPC) Ignore spaces before ( . . . . .	935	Message changed for Frank . . . . .	1185
1994-04-28 ltplain.dtx v1.0g General: Turn off overfull box tracing in log . . . . .	23	General: <code>\@activechar@warning</code> changed to an info message. . . . .	1168
1994-04-29 ltclass.dtx v1.0a General: Change version number to 1 (no other change) . . . . .	1054	Added <code>\col@number</code> . . . . .	1168
1994-04-29 ltmiscen.dtx v1.0f <code>\@verbatim</code> : <code>\leavevmode</code> added . . . . .	846	Documentation tidied. . . . .	1168
Change to <code>\everypar</code> added . . . . .	846	Empty column action added. . . . .	1168
1994-04-29 ltoutenc.dtx 1.4a General: Removed <code>\EncodingSpecific</code> . Renamed all the commands. Added <code>\DeclareTextGlyph</code> and <code>\UndeclareTextCommand</code> . . . . .	482	Fixed bug from <code>\dblfigrule</code> with <code>\@topnewpage</code> . . . . .	1168
Removed Rokicki's OT1 variant encoding. Moved the driver to the top. . . . .	481	Full of floats action improved. . . . .	1168
		<code>\col@number</code> : Added <code>\col@number</code> . . . . .	1180
		<code>\onecolumn</code> : Added setting of <code>\col@number</code> . . . . .	1182
		1994-05-01 lterror.dtx v1.0k <code>\@latexerr</code> : (CAR) Added draft <code>\@latexinfo</code> . . . . .	406
		1994-05-01 ltoutenc.dtx 1.4a General: Added the <code>\a</code> command. . . . .	491
		Added the <code>\SaveAtCatcode</code> and <code>\RestoreAtCatcode</code> commands. . . . .	494
		Removed the uc/lc table settings, since the T1 uc/lc table is now the default. . . . .	502

Rewrote for the new syntax. . . . .	494, 497	<code>\end@float</code> : (CAR) Added	
1994-05-01 ltoutenc.dtx v1.4a		<code>\@largefloatcheck</code> . . . . .	990
General: Removed Rokicki's		1994-05-03 ltfsdcl.dtx v2.1f	
encoding. . . . .	478	General: Renamed	
Renamed the commands, removed		<code>\@DeclareMathDelimiter</code> to	
the <code>\EncodingSpecific</code> command.		<code>\@DeclareMathDelimiter</code> . . . . .	669
Turned all slots into decimal.		1994-05-03 ltlists.dtx v1.0d	
Added <code>\a</code> . . . . .	478	<code>\@item</code> : <code>\hskip</code> changed to <code>\kern</code> . .	884
1994-05-02 ltcntrl.dtx v1.0l		<code>\item</code> : Removed superfluous braces	883
<code>\@break@tfor</code> : Macro added (from		1994-05-03 ltmiscen.dtx v1.0h	
ltfiles.dtx) . . . . .	399	<code>\@centercr</code> : <code>\@badcrerr</code> replaced by	
1994-05-02 ltdefns.dtx v1.1f		<code>\@nolnerr</code> . . . . .	842
<code>\renewcommand</code> : Removed surplus		1994-05-03 lttab.dtx v1.0d	
<code>\space</code> in error . . . . .	85	<code>\@endpbox</code> : Use <code>\@finalstrut</code> based	
<code>\renewenvironment</code> : Removed surplus		on depth of <code>\@arstrutbox</code> . . . . .	931
<code>\space</code> in error . . . . .	86	1994-05-04 ltclass.dtx v1.0b	
1994-05-02 ltfiles.dtx v1.0f		<code>\NeedsTeXFormat</code> : Changed wording of	
<code>\@iffilenamepath</code> : <code>\@break@loop</code>		the warning . . . . .	1074

- 1994-10-27 ltoutenc.dtx v1.5d  
 General: Rewrote  
   `\DeclareTextSymbol` to define its  
   argument to use the current  
   encoding by default, to fit with  
   `\DeclareTextCommand`. . . . . 482
- 1994-10-27 ltoutenc.dtx v1.6b  
 General: Added `\textbackslash`. . . 503  
 Added more defaults for OT1. . . 491  
 Removed the enc.def files . . . . . 478  
 Removed the files OT1enc.def,  
 T1enc.def and OMSenc.def. . . . 491  
 Renamed `\textlbrace` to  
   `\textbraceleft` and `\textrbrace`  
   to `\textbraceright`. . . . . 503
- 1994-10-29 ltmath.dtx 1.0m  
 General: ASAJ: Added  
   `\DeclareMathOperator`. . . . . 853  
 ASAJ: Tidied up documentation. 861
- 1994-10-29 ltmath.dtx v1.0m  
 General: ASAJ: Added  
   `\mathellipsis`, `\mathdollar` and  
   `\mathsterling`. . . . . 860  
 ASAJ: Removed `\dag`, `\ddag`. . . 860  
 ASAJ: Renamed `\S` and `\P` to  
   `\mathsection` and  
   `\mathparagraph` and made them  
   `\mathchardefs`. . . . . 860
- 1994-10-29 ltoutenc.dtx v1.6c  
 General: Added commands like `\dots`  
   for use in text and math. . . . . 491  
 Renamed `\P`, `\S`, `\dag` and `\ddag` to  
   `\textparagraph`, `\textsection`,  
   `\textdagger` and  
   `\textdaggerdbl`. . . . . 478
- 1994-10-30 ltdefns.dtx v1.2c  
   `\@onelevel@sanitize`: Macro added 109  
 General: (CAR)`\@onelevel@sanitize`  
   added . . . . . 78
- 1994-10-30 ltdefns.dtx v1.2f  
 General: (DPC)`\newwrite`'s moved to  
   ltfiles . . . . . 78
- 1994-10-30 ltmath.dtx v1.0n  
 General: ASAJ: Moved the new  
   commands to ltoutenc. . . . . 860
- 1994-10-30 ltoutenc.dtx v1.6d  
 General: Added  
   `\DeclareTextCompositeCommand`. 478  
 Added `\textcircled`. . . 478, 492, 503  
 Added `\t`. . . . . 492  
 Added math commands. . . . . 478  
 Added OML encoding. . . . . 478, 492  
 Added the OML encoding. . . . . 503
- Made `\textless` and `\textgreater`  
 come from OML. . . . . 492  
 Moved math commands here from  
 ltmath. . . . . 494  
 Removed `\textregistered`. . . . 492  
 Rewrote `\copyright` to use  
   `\textcircled`. . . . . 492
- 1994-10-31 fontdef.dtx v2.2d  
 General: Added OMLenc.def ... . 734
- 1994-10-31 fontdef.dtx v2.2e  
 General: ... and moved further down 734
- 1994-10-31 ltfloat.dtx v1.1a  
   `\@dblfloat`: Major changes since  
   two-column and one-column cases  
   merged . . . . . 986  
   `\@dblflset`: Macro added . . . . . 986  
 Major changes to parameter  
 parsing, setting of local variables,  
 etc; two-column and one-column  
 cases merged; space hacks moved 986  
   `\@endfloatbox`: (DPC/CAR) Extra  
   box added to remove colour  
   resetting from vmode . . . . . 992  
   `\@floatboxreset`: Macro added . . . 990  
   `\@footnotetext`: (DPC/CAR) Move  
   colour setting to output routine 1002  
   `\@savemarbox`: (DPC/CAR) Extra  
   box added for colour . . . . . 996  
   `\@setfps`: Macro added . . . . . 987  
   `\@xdblfloat`: Macros removed:  
   `\@dbflt`, `\@xdblfloat` . . . . . 992  
   `\@xfloat`: (DPC/CAR) Extra box  
   added to remove colour resetting  
   from vmode . . . . . 988  
 Major changes, removing setting of  
 local variables, space hacks etc;  
 two-column and one-column cases  
 merged . . . . . 987  
 Reset hook added . . . . . 988  
   `\@xympar`: (DPC/CAR) Extra box  
   added since needed for floats . . . 997  
   `\fps@dbl`: Macro added . . . . . 987
- 1994-10-31 ltoutput.dtx v1.1a  
   `\@topnewpage`: (DPC/CAR) Extra  
   box added to remove colour  
   resetting from vmode . . . . . 1184  
 (DPC/CAR) Use  
   `\color@begingroup` for colour . 1184  
 (DPC/CAR) Use `\normalcolor` 1184
- 1994-11-02 ltoutenc.dtx v1.6d

<code>fontdef.dtx.</code> . . . . .	494	in various places . . . . .	14

<code>\offinterlineskip</code> : Replaced 1000 by <code>\@m</code> . . . . .	27	<code>\@writefile</code> : Added missing percent and use <code>\relax</code> in the THEN case	835
<code>\showoutput</code> : Use <code>\showoverfull</code> to save space . . . . .	31	<code>\@xobeysp</code> : Use <code>\nobreak</code> . . . . .	845
<code>\tracingall</code> : Use <code>\showoutput</code> to save space . . . . .	31	General: Improve Documentation . .	828
1995-07-03 <code>ltdefns.dtx</code> v1.2o <code>\set@typeset@protect</code> : Use <code>\@typeset@protect</code> for init . . . . .	92	<code>\enddocument</code> : Set <code>\@setckpt</code> to <code>\@gobbletwo</code> instead of defining it by hand . . . . .	829
1995-07-03 <code>ltfntcmd.dtx</code> v3.3s <code>\tst@ic</code> : Use clean interface for jump . . . . .	762	Shorten redefinition of <code>\bibcite</code> and <code>\newlabel</code> . . . . .	830
1995-07-05 <code>ltfntcmd.dtx</code> v3.3s <code>\tst@ic</code> : Renamed from <code>\test@next</code>	762	1995-07-14 <code>ltbibl.dtx</code> v1.1i <code>\bibcite</code> : Remove <code>\onlypreamble</code> so still defined in new <code>\enddocument</code> . . . . .	1010
1995-07-05 <code>ltspace.dtx</code> v1.2h <code>\@gnewline</code> : Use <code>\break</code> . . . . .	439	1995-07-14 <code>ltxref.dtx</code> v1.1g <code>\newlabel</code> : Remove <code>\onlypreamble</code> so still defined in new <code>\enddocument</code> . . . . .	809
<code>\@no@pgbk</code> : Macro replaces <code>\@pgbk</code> and <code>\@nopgbk</code> . . . . .	437	1995-07-19 <code>ltfssini.dtx</code> v3.0d General: (DPC) TeX2 support . . . .	730
<code>\nopagebreak</code> : Reimplemented both using <code>\@no@pgbk</code> . . . . .	436	1995-07-20 <code>ltboxes.dtx</code> v1.0v <code>\@isavebox</code> : Use <code>\sbox</code> . . . . .	895
1995-07-09 <code>ltcntrl.dtx</code> v1.0f <code>\iforloop</code> : Reimplemented using Kabelschacht method . . . . .	399	<code>\@isavepicbox</code> : Use <code>\sbox</code> . . . . .	895
<code>\@iwhiledim</code> : Reimplemented using Kabelschacht method . . . . .	397	1995-07-21 <code>ltoutput.dtx</code> v1.1o <code>\@writesetup</code> : Command added . .	1208
<code>\@iwhilenum</code> : Reimplemented using Kabelschacht method . . . . .	397	New, experimental, versions: need in-lining . . . . .	1208
<code>\@iwhilesw</code> : Reimplemented using Kabelschacht method . . . . .	397	1995-08-09 <code>ltmath.dtx</code> v1.0u General: Added code for class options <code>leqno</code> and <code>fleqn</code> . . . . .	868
<code>\@tfor</code> : Reimplemented using Kabelschacht method . . . . .	399	1995-08-11 <code>ltnlength.dtx</code> v1.1b General: Doc typos fixed for <code>latex/753</code> . . . . .	536
1995-07-09 <code>ltlists.dtx</code> v1.0j <code>enumerate</code> : Use <code>\expandafter</code> . . . .	887	1995-08-16 <code>ltcntrl.dtx</code> v1.0g <code>\@break@tfor</code> : Made long . . . . .	399
<code>itemize</code> : Use <code>\expandafter</code> . . . . .	888	<code>\@forloop</code> : Made defs long . . . . .	399
1995-07-12 <code>ltpictur.dtx</code> v1.1d General: allow 2e commands in 209 mode. <code>latex/1737</code> . . . . .	933	<code>\@fornoop</code> : Made defs long . . . . .	399
1995-07-13 <code>ltdefns.dtx</code> v1.0p General: Updates to documentation .	78	<code>\@iforloop</code> : Made defs long . . . . .	399
1995-07-13 <code>ltfiles.dtx</code> v1.0u General: Updates to docu . . . . .	454	<code>\@iwhiledim</code> : Made defs long . . . .	397
1995-07-13 <code>ltfssbas.dtx</code> v3.0d <code>\@@defaultsubs</code> : macro added . . . .	561	Removed <code>\@whilenoop</code> . . . . .	397
<code>\@defaultsubs</code> : macro added . . . . .	561	<code>\@iwhilenum</code> : Made defs long . . . .	397
General: minor documentation changes . . . . .	538	Removed <code>\@whilenoop</code> . . . . .	397
<code>\wrong@fontshape</code> : Change a macro not a switch to flag default font substitutions . . . . .	560	<code>\@iwhilesw</code> : Removed <code>\@whileswnoop</code> . . . . .	397
1995-07-13 <code>ltmiscen.dtx</code> v1.0z <code>\@centercr</code> : Use <code>\nobreak</code> . . . . .	842	<code>\@tfor</code> : Made defs long . . . . .	399
<code>\@enddocument@kernel@warnings</code> : Use <code>\@defaultsubs</code> instead of switch	831	1995-08-16 <code>ltfiles.dtx</code> v1.0v <code>\document</code> : set <code>\@maxdepth</code> . . . . .	458
		set <code>\do</code> globally . . . . .	458
		set <code>\topskip</code> globally . . . . .	458
		1995-08-24 <code>ltfssbas.dtx</code> v3.0f General: Added autoload code . . . .	538
		1995-08-24 <code>ltfstrc.dtx</code> v3.0c General: Macro <code>\gobble@font@spec</code> removed . . . . .	652
		<code>\tryis@simple</code> : . . . . .	659

1995-08-25 ltoutput.dtx v1.1p	1995-10-10 ltssdcl.dtx v3.0c
General: Support autoloading feature (FMi). . . . .	<code>\non@alpherr</code> : (DPC) autoload error message . . . . .
1995-09-01 lterror.dtx v1.2i	1995-10-10 ltplain.dtx v1.1r
General: Add autoload support . . .	General: Autoload tracing code . . . .
1995-09-01 ltplain.dtx v1.1m	1995-10-10 ltthm.dtx v1.0f
<code>\empty</code> : Use <code>\let</code> to save space . . . .	General: Make <code>\newtheorem</code> ‘only preamble’ . . . . .
<code>\I</code> : Use <code>\let</code> to save space . . . . .	1995-10-11 ltoutput.dtx v1.1r
1995-09-14 ltplain.dtx v1.1o	<code>\clearpage</code> : Added a check so that it does not lose the argument of <code>\twocolumn[...]</code> . . . . .
General: Moved <code>\multispan</code> to lttab.dtx . . . . .	1995-10-16 ltbibl.dtx v1.1j
1995-09-14 lttab.dtx v1.1c	<code>\cite</code> : (DPC) Make robust . . . . .
<code>\cline</code> : (DPC) New implementation . . . . .	1995-10-16 ltboxes.dtx v1.0w
1995-09-15 ltssini.dtx v3.0e	General: Clarify makebox description . . . . .
General: (DPC) Modify TeX2 message . . . . .	1995-10-16 ltdefs.dtx v1.2u
1995-09-19 ltmiscen.dtx v1.1a	<code>\@ifstar</code> : (DPC) New implementation, for /1910 . . . . .
<code>\verb</code> : Put <code>\enoligs</code> after <code>\verbatim@font</code> where it belongs. . . . .	<code>\new@command</code> : (DPC) Use <code>\@testopt</code> /1911 . . . . .
1995-10-01 ltfiles.dtx LaTeX2e	<code>\new@environment</code> : (DPC) Use <code>\@testopt</code> /1911 . . . . .
<code>\addtofilelist</code> : Macro added . . .	<code>\typein</code> : (DPC) Use <code>\@testopt</code> /1911 . . . . .
1995-10-02 ltdefs.dtx v1.2q	1995-10-16 ltssini.dtx v3.0f
<code>\ifnch</code> : Use <code>\@let@token</code> for internal/924, save <code>\reserved@e</code> . . . . .	<code>\reset@font</code> : Added <code>\relax</code> after <code>\usefont</code> , as the latter eats up spaces. . . . .
<code>\ifnextchar</code> : Use <code>\@let@token</code> . . . . .	1995-10-16 ltmath.dtx v1.0y
<code>\@protected@testopt</code> : Macro added . . . . .	<code>\@yeqncr</code> : (DPC) Use <code>\@testopt</code> /1911 . . . . .
<code>\@testopt</code> : Macro added . . . . .	<code>\sqrt</code> : (DPC) Make robust /1808 . . . . .
<code>\xargdef</code> : New implementation, using <code>\@test@opt</code> . . . . .	1995-10-16 ltspc.dtx v1.2j
1995-10-03 fontdef.dtx v2.2l	<code>\nolinebreak</code> : (DPC) Use <code>\@testopt</code> /1911 . . . . .
General: <code>\@sqrt</code> from patch file for /1701 . . . . .	<code>\nopagebreak</code> : (DPC) Use <code>\@testopt</code> /1911 . . . . .
1995-10-03 ltdefs.dtx v1.2r	1995-10-16 ltthm.dtx v1.0g
<code>\typein</code> : Add missing <code>\@typein</code> for /1710 (from patch file) . . . . .	General: Revert to previous <code>\newtheorem</code> behaviour . . . . .
1995-10-03 ltpictur.dtx v1.1e	1995-10-17 ltclass.dtx v1.0r
General: New autoload code . . . . .	<code>\@providesfile</code> : Delay definition of <code>\ProvidesFile</code> till ltfinal . . . . .
1995-10-04 ltssbas.dtx v3.0g	<code>\ProcessOptions*</code> : Reset <code>\CurrentOption</code> for graphics/1873 . . . . .
General: Modify autoload code . . . .	1995-10-17 ltdirchk.dtx v1.0l
1995-10-04 ltssstrc.dtx v3.0d	General: Modify initex version of <code>\ProvidesFile</code> . . . . .
General: (DPC) Modify autoload code . . . . .	1995-10-17 ltfinal.dtx v1.0v
1995-10-04 lttab.dtx v1.1d	<code>\@providesfile</code> : reset macro . . . . .
General: Modify autoload support . . . . .	<code>\reserved@b</code> : reset here after the <code>\input</code> above . . . . .
1995-10-06 ltfiles.dtx v1.0w	
<code>\@missingfileerror</code> : Autoload error . . . . .	
1995-10-09 lterror.dtx v1.2j	
General: Modify autoload support . . . . .	
1995-10-09 ltoutenc.dtx v1.7m	
<code>\@inmathwarn</code> : Autoload error . . . .	
1995-10-10 ltssbas.dtx v3.0h	
<code>\showhyphens</code> : Use <code>\normalfont</code> and make colour safe, and autoloadable . . . . .	

1995-10-17 ltplain.dtx v1.1s	Use <code>\@refundefined</code> instead of switch	831
<code>\eject</code> : Move <code>\supereject</code> to compat file		28
1995-10-17 lttab.dtx v1.1e	<code>\@cline</code> : (DPC) Use <code>\@multicnt</code>	931
<code>\@multispan</code> : (DPC) Macro added.		931
1995-10-19 ltfinal.dtx v1.0w	<code>\@filelist</code> : Move after <code>\reserved@a</code> setting	1302
1995-10-20 ltbibl.dtx v1.1k	<code>\@citex</code> : Removed <code>refundefined</code> flag	1011
<code>\nocite</code> : Removed <code>refundefined</code> flag		1012
1995-10-20 ltclass.dtx v1.0s	<code>\@begindocumenthook</code> : Make setting conditional, for autoload version	1084
1995-10-20 ltssbas.dtx v3.0i	General: (DPC) Modify autoload code, change <code>\undefined</code>	538
1995-10-20 ltssstrc.dtx v3.0e	General: (DPC) Modify autoload code	638
1995-10-22 ltssbas.dtx v3.0j	General: (RmS) New size function macro <code>\genb@sfcnt</code> needs to be disabled at <code>\document.</code>	538
1995-10-22 ltssstrc.dtx v3.0f	General: Added ‘genb’ and ‘sgenb’ size functions to support new DC font naming scheme.	638
1995-10-23 lttab.dtx v1.1f	<code>\@settab</code> : (CAR)Ensure that <code>\@hightab</code> increases by at most one	915
<code>\@startline</code> : (CAR)Ensure that <code>\@nxttabmar</code> is never larger than <code>\@hightab</code>		913
<code>\poptabs</code> : (CAR)Ensure that <code>\@curtab</code> is never larger than <code>\@hightab</code>		916
<code>\tabbing</code> : (CAR)Make <code>\@hightab</code> consistently a local variable		915
1995-10-24 ltfiles.dtx v1.1a	<code>\document</code> : Removed <code>multiplelabels</code> switch	457
Removed <code>refundefined</code> switch		457
1995-10-24 ltssbas.dtx v3.0k	<code>\@@defaultsubs</code> : macro removed	561
<code>\wrong@fontshape</code> : Make this code inline since it happens only here		560
1995-10-24 ltmiscen.dtx v1.1b	<code>\@enddocument@kernel@warnings</code> : Changed logic for producing warning messages and removed switch	831
1995-10-24 ltxref.dtx v1.1h	<code>\@multiplelabels</code> : Switch for <code>multiplelabels</code> removed	810
<code>\@newl@bel</code> : Switch for <code>multiplelabels</code> replaced by inline code		809
<code>\@refundefined</code> : Switch for <code>refundefined</code> replaced		807
<code>\@setref</code> : Switch for <code>refundefined</code> renamed		808
<code>\if@multiplelabels</code> : Macro removed		810
1995-10-25 ltalloc.dtx v1.1b	General: General doc improvements	394
1995-10-25 ltfloat.dtx v1.1n	<code>\@endfloatbox</code> : (CAR) macro added: to unify code for double and single versions	992
<code>\end@dblfloat</code> : (CAR) unify code for double and single versions		991
<code>\end@float</code> : (CAR) unify code for double and single versions		990
1995-10-25 ltidxglo.dtx v1.1d	General: Doc cleanup	1006
1995-10-25 ltsect.dtx v1.0q	<code>\subparagraphmark</code> : Use <code>\let</code> not <code>\def</code> to save space.	977
1995-10-27 ltpictur.dtx v1.1f	General: Move initialization to kernel from autoload file	960
1995-10-31 ltboxes.dtx v1.0x	<code>\@finalstrut</code> : Add <code>\nobreak</code> in horis mode to allow hyphenation. internal/1931	906
1995-11-01 fontdef.dtx v2.2m	General: add <code>\nfss@catcodes</code> for internal/1932	735
1995-11-01 ltdirchk.dtx v1.0n	General: Initialise <code>\@addtofilelist</code> to <code>\@gobble</code>	4
1995-11-01 ltfinal.dtx v1.0x	General: (DPC) Switch meaning of <code>\@addtofilelist</code> for cfg files	1290
1995-11-01 ltssbas.dtx v3.0m	<code>\DeclareFontShape@</code> : (DPC) Test for <code>\relax</code> not <code>\undefined</code> , internal/1933	539
1995-11-01 ltssini.dtx v3.0g	General: (DPC) Switch meaning of <code>\@addtofilelist</code> for cfg files	730
1995-11-02 ltssbas.dtx v3.0n	<code>\wrong@fontshape</code> : (DPC) Remove extra space with <code>\string</code> for latex/1676	560

- 1995-11-02 ltoutenc.dtx v1.7n  
 General: Changed internal name `\a` to `\@tabacckludge` to protect against redefinition by malicious users. . 491
- 1995-11-07 ltlists.dtx v1.0k  
`\@doendpe`: Enclosed `\setbox0` assignment by a group so that it leaves the contents of box 0 intact. . . . . 882
- 1995-11-07 ltoutenc.dtx v1.7o  
 General: Added `\leavevmode` at start of `\c`, otherwise the output routine might be invoked within the macro. . . . . 495  
 Changed `\char32` to `\@xxxii` (two tokens less). . . . . 496  
 Replaced octal number 27 by decimal number 23 to protect against the quote character being active. . . . . 496  
 Replaced some 0's by `\z@` (faster). 496
- 1995-11-10 ltoutput.dtx v1.1s  
`\@shipoutsetup`: Command removed . . . . . 1208  
`\@writesetup`: Command removed 1208  
 In-lined . . . . . 1208
- 1995-11-14 ltclass.dtx v1.0t  
`\@unprocessedoptions`: Allow empty option . . . . . 1085  
`\@loadwithoptions`: macro added 1072  
`\LoadClassWithOptions`: macro added . . . . . 1073  
`\RequirePackageWithOptions`: macro added . . . . . 1073
- 1995-11-17 ltfssbas.dtx v3.0m  
`\@wrong@font@char`: (DPC) Macro added. latex/1676 . . . . . 561  
`\define@newfont`: Redefine `\typeout` latex/1676 . . . . . 554  
`\wrong@fontshape`: Support `\@wrong@font@char` latex/1676 . 560
- 1995-11-17 ltoutenc.dtx v1.7p  
`\UseTextSymbol`: Support `\@wrong@font@char` latex/1676 . 488
- 1995-11-18 ltoutenc.dtx v1.7q  
`\UseTextSymbol`: Modify message slightly . . . . . 488
- 1995-11-21 fontdef.dtx v2.2n  
 General: Incorporate changed figures, as in plain.tex . . . . . 749
- 1995-11-27 ltfssbas.dtx v3.0n  
`\nfss@catcodes`: Reset hash, for definitions in fd files . . . . . 556
- 1995-11-28 ltfloat.dtx v1.1n  
 General: documentation fixes . . . . . 983
- 1995-11-28 ltfssstrc.dtx v3.0g  
 General: documentation fixes . . . . . 638
- 1995-11-28 ltoutenc.dtx v1.7r  
 General: Added math mode checks to text commands. . . . . 482  
 doc fixes . . . . . 478  
 Renamed `\@changed@x@err` to `\TextSymbolUnavailable`. . . . . 482
- 1995-11-29 ltoutenc.dtx v1.7t  
 General: Added `\textasciicircum`, `\textasciitilde`, `\textbackslash`, `\textbar`, `\textgreater` and `\textless`. . . 498  
 Added `\textasciicircum`, `\textasciitilde`, `\textregistered` and `\texttrademark`. . . . . 492  
 Added `\textbackslash` and `\textbar`. . . . . 492, 503  
 Added `\textless` and `\textgreater`. . . . . 492, 503
- 1995-12-01 ltoutenc.dtx v1.7u  
 General: Made `\SS` a Default, rather than having the default point to the OT1 definition. . . . . 492
- 1995-12-04 ltspace.dtx v1.2k  
`\nobreakspace`: Macro added . . . . . 449
- 1995-12-04 ltspace.dtx v1.2l  
`\@xobeysp`: braces added to definition of tilde . . . . . 450
- 1995-12-04 preload.dtx v2.4e  
 General: Ulrik Vieth. added 12pt OMS and OML preloads /1989 . 755
- 1995-12-05 ltdefs.dtx 1.2w  
`\@unexpandable@protect`: Removed `\unexpandable@noexpand` as never used. internal/1733 . . . . . 90
- 1995-12-05 ltfiles.dtx v1.1c  
`\document`: `\ignorespaces` added for latex/1933 . . . . . 458
- 1995-12-05 ltfloat.dtx v1.1n  
`\@textsuperscript`: Use `\ensuremath` for latex/1984. . . . . 1001
- 1995-12-05 ltoutenc.dtx v1.7v  
`\@inmathwarn`: Changed `\TextSymbolUnavailable` text . . 484
- 1995-12-06 ltfssbas.dtx v3.00  
`\nfss@catcodes`: Reset hat, for typeouts etc in fd files . . . . . 556
- 1995-12-07 ltbibl.dtx v1.1l  
`\@citex`: Restored name of `\G@refundefinedtrue` . . . . . 1011

1995-12-07 lfloat.dtx v1.1m	1996-05-17 fontdef.dtx v2.2o

<code>\catcodetable@initex</code> : Macro added	47	<code>\newlanguage</code> : Only extend allocation of write streams (see <code>luatex</code> list) .	17
<code>\catcodetable@latex</code> : Macro added .	47	2015-11-27 <code>ltluatex.dtx</code> v1.0h	
<code>\catcodetable@string</code> : Macro added	47	<code>callback_descriptions</code> : Match test in in-callback <code>latex/4445</code> . . . . .	69
<code>add_to_callback</code> : Function added . .	66	<code>in_callback</code> : Guard against undefined list <code>latex/4445</code> . . . . .	69
<code>remove_from_callback</code> : Function added . . . . .	68	2015-11-29 <code>ltluatex.dtx</code> v1.0i	
<code>new_attribute</code> : Function added . . . .	55	General: Declare this as local before used in the module error definitions (PHG) . . . . .	52
<code>disable_callback</code> : Function added .	69	<code>call_callback</code> : Check name is not nil in error message (PHG) . . . . .	65
<code>in_callback</code> : Function added . . . . .	69	<code>create_callback</code> : Check name is not nil in error message (PHG) . . . . .	65
<code>\newattribute</code> : Macro added . . . . .	47	2015-12-02 <code>ltluatex.dtx</code> v1.0j	
<code>\newcatcodetable</code> : Macro added . . .	47	General: Adjust <code>hashtokens</code> to store the result of <code>tex.hashtokens()</code> , not the function (PHG) . . . . .	54
<code>\newluabytecode</code> : Macro added . . . .	50	Assorted typos fixed (PHG) . . . . .	44
<code>\newluachunkname</code> : Macro added . . .	50	Declaration/use of <code>first_head</code> fixed (PHG) . . . . .	53
<code>\newluafunction</code> : Macro added . . . .	49		
<code>\newwhatsit</code> : Macro added . . . . .	49		
<code>module_error</code> : Function added . . . .	54		
<code>module_info</code> : Function added . . . . .	54		

Remove nonlocal iteration variables (PHG) . . . . .	44	<code>\DeclareMathAccent</code> : Check for <code>mathaccent</code> not <code>\mathaccent</code> . . .	690
Remove unreachable code after calls to <code>error()</code> (PHG) . . . . .	44	<code>\DeclareMathRadical</code> : Check for <code>radical</code> not <code>\radical</code> . . . . .	698
2015-12-02 ltluatex.dtx v1.0k		<code>\DeclareMathSymbol</code> : Check for <code>mathchar</code> not <code>\mathchar</code> . . . . .	693
General: resolve name and <code>i.description</code> (PHG) . . . . .	63	2016-03-13 ltluatex.dtx v1.0n	
<code>call_callback</code> : Give more specific error messages (PHG) . . . . .	65	General: contribute <code>_filter</code> added . . . .	61
<code>add_to_callback</code> : Give more specific error messages (PHG) . . . . .	66	<code>insert_local_par</code> added . . . . .	61
<code>remove_from_callback</code> : adjust initialization of <code>cb local</code> (PHG) . .	68	2016-03-29 ltpictur.dtx v1.1l	
Give more specific error messages (PHG) . . . . .	68	<code>\@oval</code> : add setting of line tests . . . . .	955, 956
<code>create_callback</code> : Give more specific error messages (PHG) . . . . .	65	initialise tests . . . . .	955
2015-12-10 ltfinal.dtx v2.0i		<code>\@ovhorz</code> : use glue not leaders if horizontal line not required . . . .	958
General: Use new common Unicode data loaders . . . . .	1288	<code>\@ovvert</code> : use glue not leaders if vertical line not required . . . . .	957
2015-12-18 ltluatex.dtx v1.0l		<code>\if@ovhline</code> : macro added (latex/4452) . . . . .	955
General: Load Unicode data from source . . . . .	47	<code>\if@ovvline</code> : macro added (latex/4452) . . . . .	955
2016-01-04 ltfinal.dtx v2.0j		2016-04-22 ltfinal.dtx v2.0q	
General: Do not set up inter character classes for XeTeX . . . . .	1288	<code>\e@alloc@intercharclass@top</code> : XeTeX 0.99996 has 4096 char classes not 256 . . . . .	1285
<code>\e@alloc@intercharclass@top</code> : Start allocation at one not three . . . .	1285	2016-06-19 ltoutenc.dtx v1.99m	
2016-01-05 ltfinal.dtx v2.0k		General: OT1 definition (was duplicate T1 definition) . . . . .	497
<code>\e@alloc@intercharclass@top</code> : Remove duplicated code . . . . .	1285	2016-06-20 ltclass.dtx v1.1j	
2016-01-05 ltfinal.dtx v2.0l		General: don't declare as <code>\@onlypreamble</code> . . . . .	1061
General: Correct <code>latexrelease</code> guards . . . . .	1288	2016-07-29 ltplain.dtx v2.2c	
Ensure old definitions for inter-character class toks are available using <code>latexrelease</code> . . . .	1288	<code>\extrafloats</code> : use <code>\global \chardef</code> . . . .	19
Missing brace . . . . .	1288	<code>\newinsert</code> : fix for <code>tlb-newinsert-001</code> . . . .	20
2016-01-05 ltfinal.dtx v2.0m		2016-10-02 ltclass.dtx v1.2a	
General: Undefine XeTeX classes when using patching an older kernel . .	1288	<code>\@ifclasswith</code> : Ignore spaces while checking for option clash . . . . .	1061
2016-01-05 ltfinal.dtx v2.0p		<code>\ExecuteOptions</code> : Ignore spaces in argument . . . . .	1071
General: Only apply XeTeX change if XeTeX is in use . . . . .	1288	2016-10-15 ltdirchk.dtx v1.2b	
2016-02-11 ltluatex.dtx v1.0m		General: Require eTeX . . . . .	3
General: <code>pdf_stream_filter_callback</code> removed . . . . .	62	2016-10-15 lterror.dtx v1.2p	
<code>process_rule</code> , <code>[hv]pack_quality</code> <code>append_to_vlist_filter</code> added . . .	61	General: Require eTeX . . . . .	400
<code>read_cidmap_file</code> added . . . . .	60	2016-10-15 ltfinal.dtx v2.0r	
<code>show_warning_message</code> added . . .	61	General: Require eTeX . . . . .	1284
<code>token_filter</code> removed . . . . .	61	2016-10-15 ltfinal.dtx v2.0s	
2016-02-18 ltfssdcl.dtx v3.0r		General: Tidy up status of char 127 . . . .	1284
<code>\@DeclareMathDelimiter</code> : Check for <code>delimiter</code> not <code>\delimiter</code> . . . . .	695	2016-10-15 ltfssini.dtx v3.1b	
		General: Require eTeX . . . . .	702
		2016-10-15 ltplain.dtx v2.2d	
		General: Require eTeX . . . . .	14
		2016-10-16 ltplain.dtx v2.3a	
		<code>\newlanguage</code> : Allow languages up to 16383 in luatex . . . . .	17

2016-10-19 ltcounts.dtx v1.1j		declare composites with empty base for hat and tilde, use same slots for <code>\textasciicircum</code> ans <code>\textasciitilde</code> . . . . .	510
<code>\TextOrMath</code> : Test directly for <code>\protected</code> . . . . .	534	declare straight quotes using new <code>\remove@tlig</code> command . . . . .	510
2016-11-06 ltplain.dtx v2.3b		2017-02-22 ltoutenc.dtx v2.0g	
General: Drop <code>\outer</code> entirely . . . . .	14	General: Fix typo introduced at 2.0f . . . . .	510
2016-11-09 ltclass.dtx v2.1b		2017-02-24 ltoutenc.dtx v2.0h	
<code>\@fileswithoptions</code> : Improve <code>\ifx</code> tests PR/4497 . . . . .	1075	General: introduce <code>\DeclareUnicodeAccent</code> . . . . .	510
2016-11-17 ltluatex.dtx v1.0p		<code>\DeclareTextCompositeCommand</code> : add check whether the accent command is defined for this encoding . . . . .	486
2016-12-03 fontdef.dtx v3.0a		2017-03-08 ltclass.dtx v1.2c	
General: (DPC) Default to TU encoding for Unicode TeX engines . . . . .	734	General: add <code>\@parse@version@dash</code> to support yyyy-mm-dd as well as yyyy/mm/dd . . . . .	1061
<code>\shapedefault</code> : (DPC) Default to TU encoding for Unicode TeX engines . . . . .	738	2017-03-09 ltfinal.dtx v2.0t	
2016-12-04 ltoutenc.dtx v2.0a		<code>\l@nohyphenation</code> : ensure <code>\l@nohyphenation</code> is defined. . . . .	1291
General: Added TU encoding . . . . .	510	2017-03-09 ltmiscen.dtx v1.1m	
2017-01-01 ltoutput.dtx v1.3b		<code>\verbatim</code> : Use <code>\language</code> not <code>\hyphenchar</code> . . . . .	846
General: make <code>fpmin</code> negative so ignored even if float height is negative . . . . .	1256	<code>\verb</code> : Use <code>\language</code> to stop hyphenation . . . . .	851
2017-01-10 ltfssbas.dtx v3.2a		2017-03-10 ltfiles.dtx v1.1n	
<code>\showhyphens</code> : Add version of <code>\showhyphens</code> that works with XeTeX. . . . .	565	<code>\document</code> : Save language default . . . . .	457
2017-01-23 ltoutenc.dtx v2.0b		2017-03-10 ltoutput.dtx v1.3c	
General: Added TU specific commands in ASCII range pr/4500 . . . . .	510	<code>\@writeseup</code> : Reset <code>\language</code> . . . . .	1208
2017-01-24 ltoutenc.dtx v2.0c		2017-03-13 ltdefs.dtx v1.5a	
General: Declare TU composites for i and j . . . . .	510	<code>\-</code> : Define <code>\-</code> in terms of <code>\hyphenchar</code> . . . . .	110
Make <code>\textasteriskcentered</code> U+2217 not U+204E . . . . .	510	2017-03-27 ltdefs.dtx v1.5b	
TeX ligature syntax for xetex and luatex reversed . . . . .	510	<code>\@dischyph</code> : Define <code>\@dischyph</code> after <code>\-</code> . . . . .	110
2017-01-24 ltoutenc.dtx v2.0d		2017-03-28 ltluatex.dtx v1.1e	
General: Declare macron composites for YyGg . . . . .	510	General: <code>glyph_stream_provider</code> added . . . . .	61
2017-02-12 ltoutenc.dtx v2.0e		2017-03-29 ltboxes.dtx v1.3a	
General: Declare fallback code for <code>\textasteriskcentered</code> . . . . .	510	<code>\@arrayparboxrestore</code> : Reset <code>\lineskiplimit</code> . . . . .	901
2017-02-18 ltluatex.dtx v1.1c		2017-04-05 ltoutenc.dtx v2.0i	
<code>new_attribute</code> : Parameterize count used in tracking . . . . .	55	<code>\DeclareTextCompositeCommand</code> : Declare accent command if not already declared when declaring a composite. . . . .	486
<code>new_bytecode</code> : Parameterize count used in tracking . . . . .	56	2017-04-10 ltplain.dtx v2.3c	
<code>new_chunkname</code> : Parameterize count used in tracking . . . . .	56	<code>\newlanguage</code> : Correction to code to skip write18 in luatex . . . . .	17
<code>new_whatst</code> : Parameterize count used in tracking . . . . .	56	2017-04-11 ltoutput.dtx v2.4a	
2017-02-19 ltoutenc.dtx v2.0f		<code>\newpage</code> : account for the depth of the last row of the page . . . . .	1182
General: add <code>\@empty</code> to guard against 3rd argument being empty . . . . .	496	2017-12-17 ltoutput.dtx v1.4b	
		<code>\@addtonextcol</code> : fix doc guards . . . . .	1232

2018-01-06 ltdefs.dtx 1.5c	2018-05-29 ltclass.dtx v1.2j
